

Private S3 Static Website hosting using CloudFront

1. Create S3 bucket:

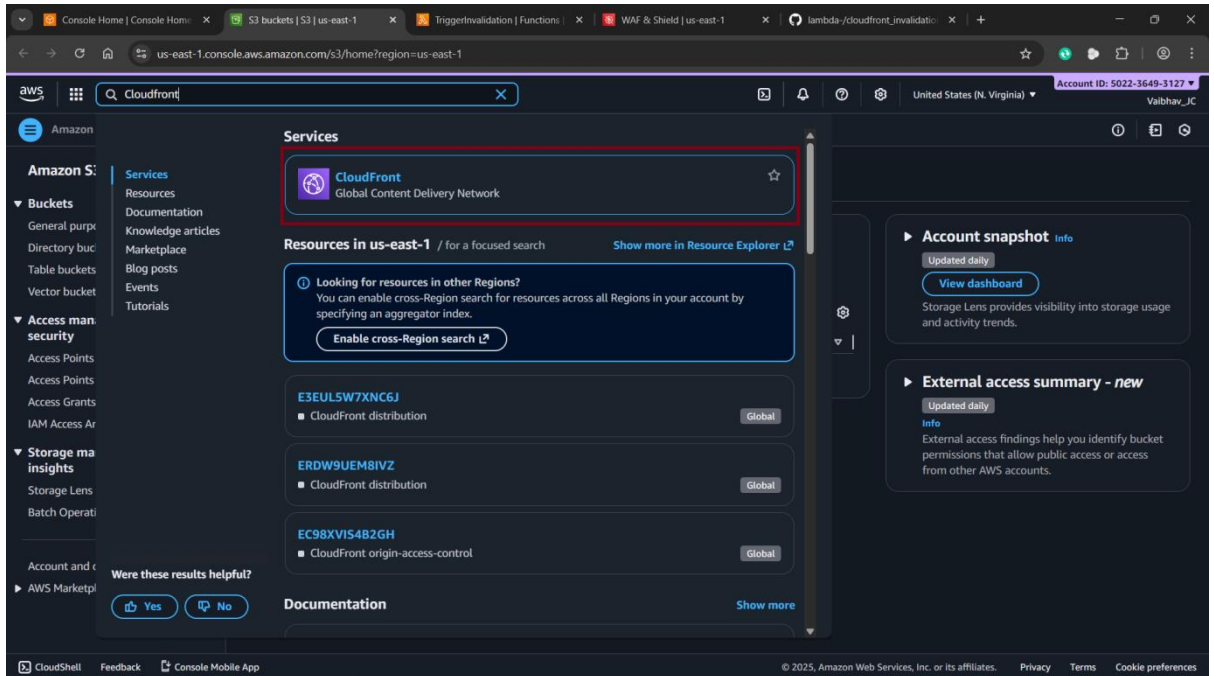

2. Make bucket private and click create bucket:

If you want versioning, you can enable versioning.

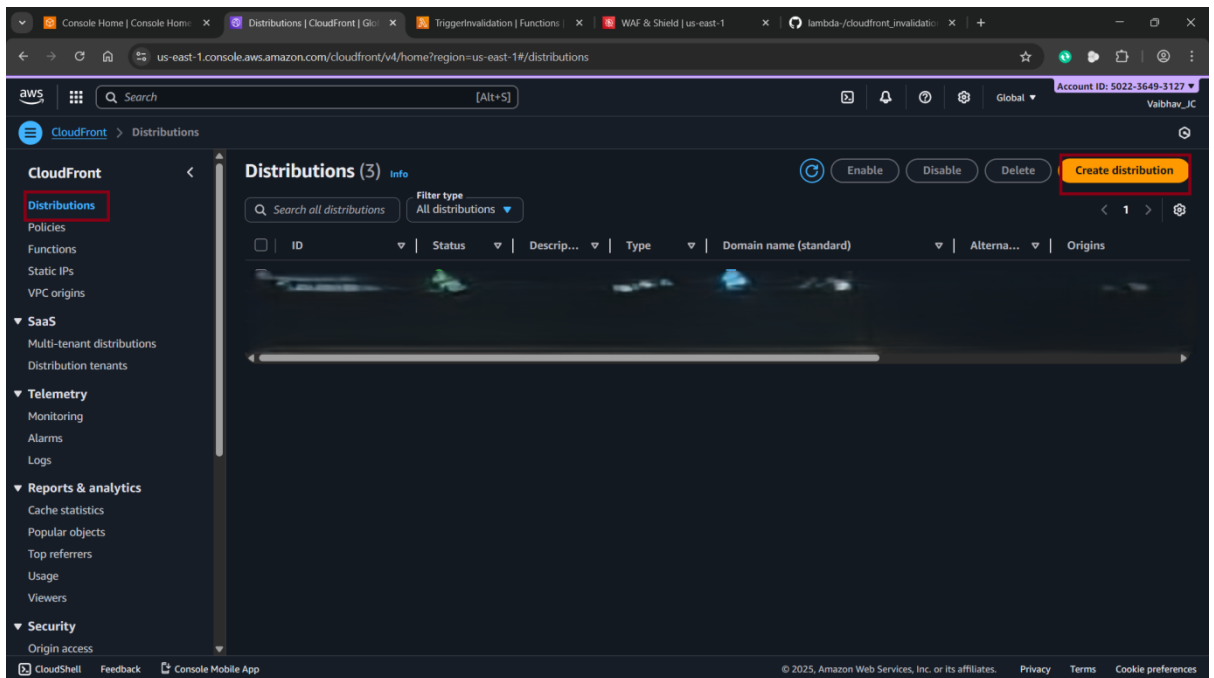

Click on create bucket.

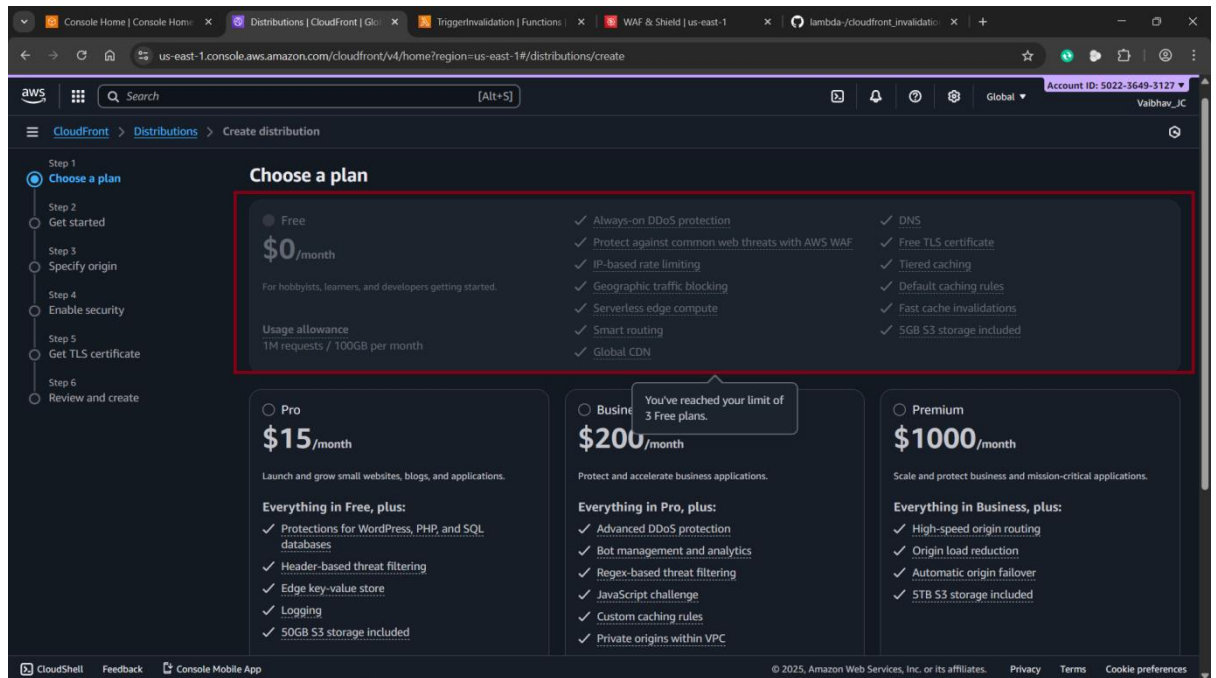

3. Search CloudFront:

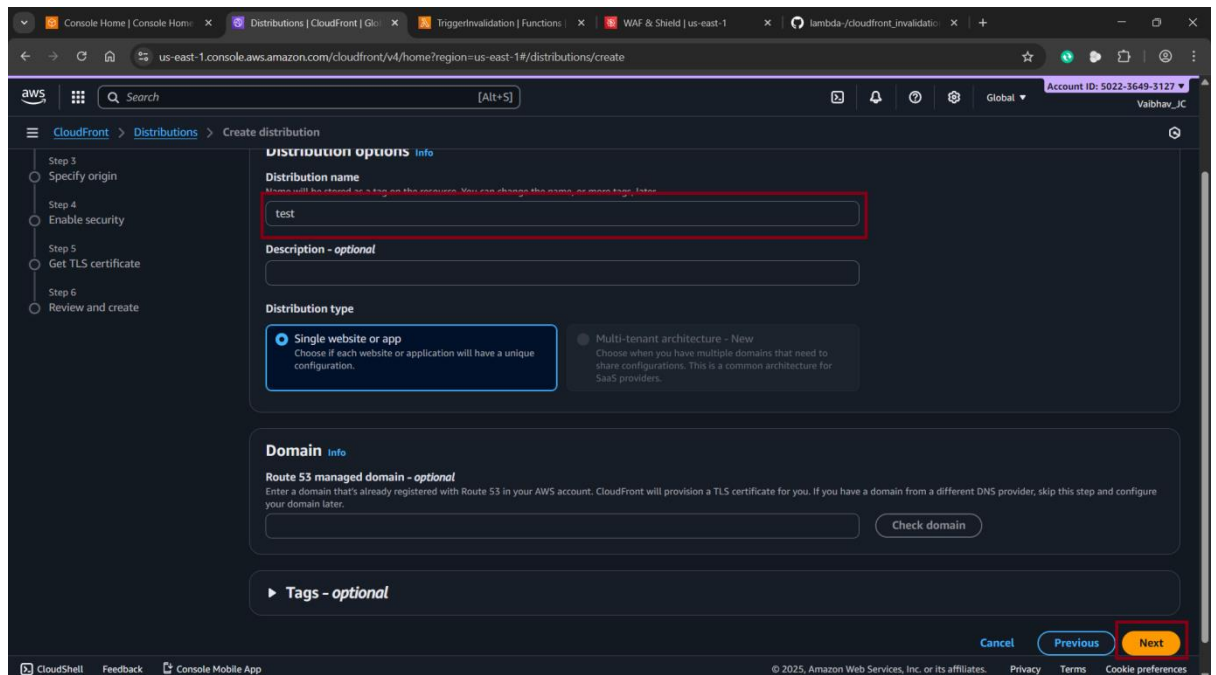

4. Click on distributions:

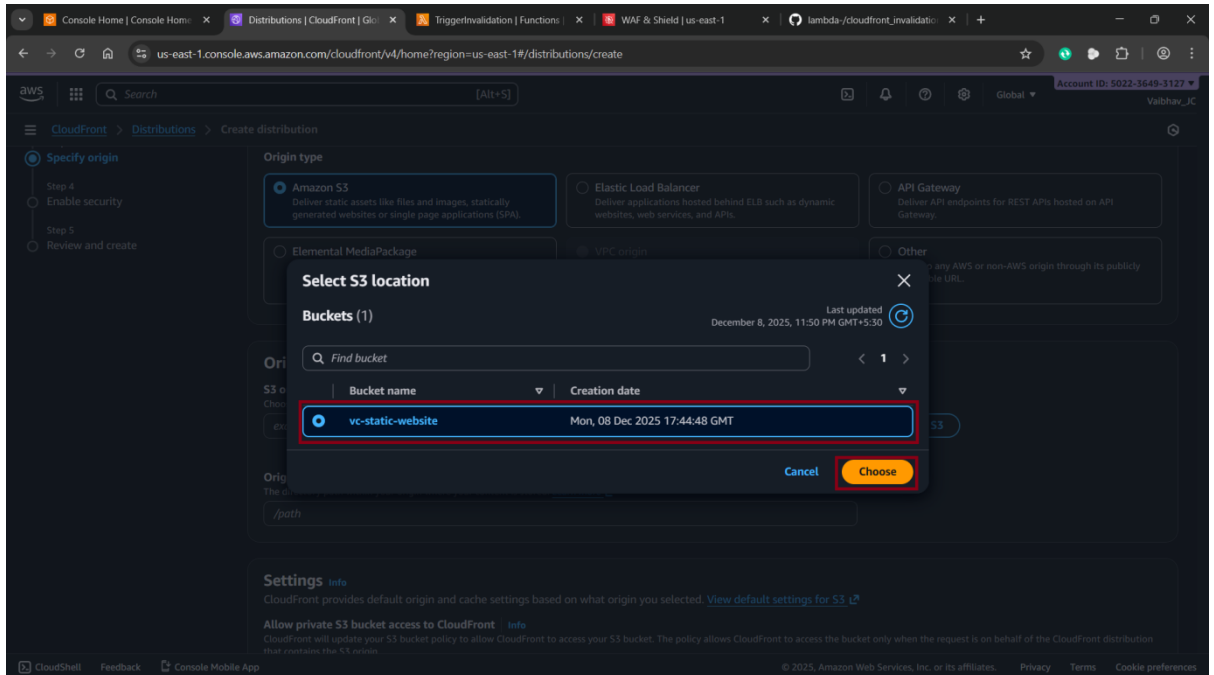

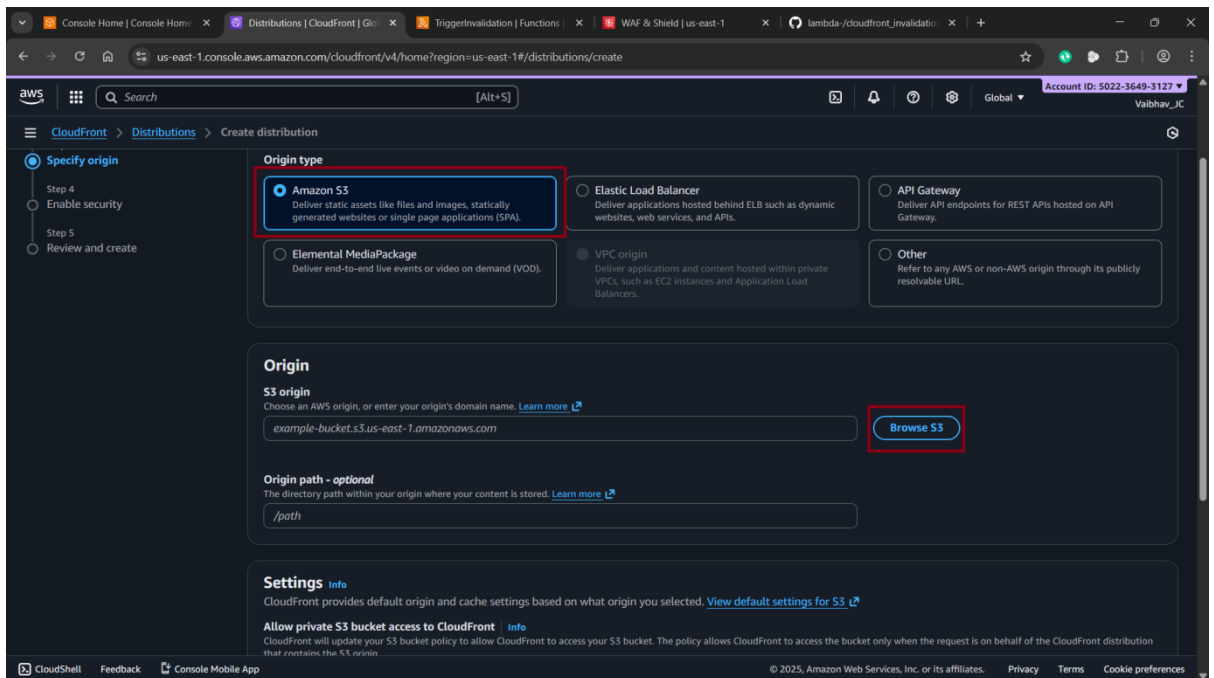

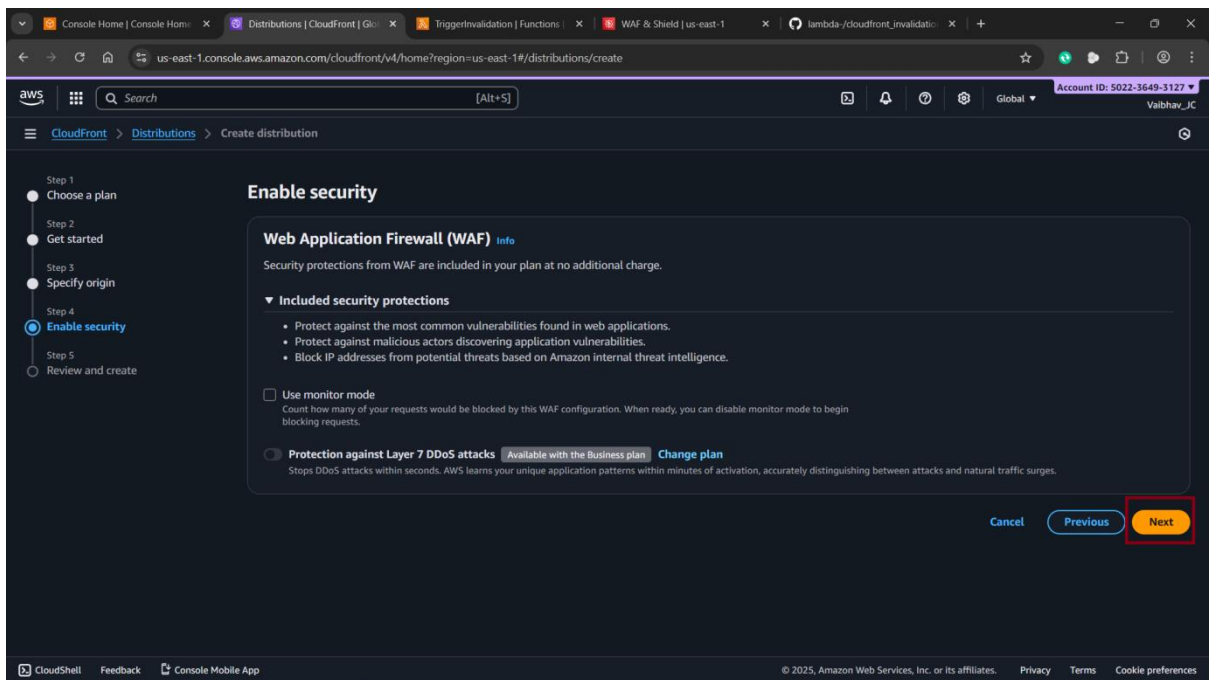

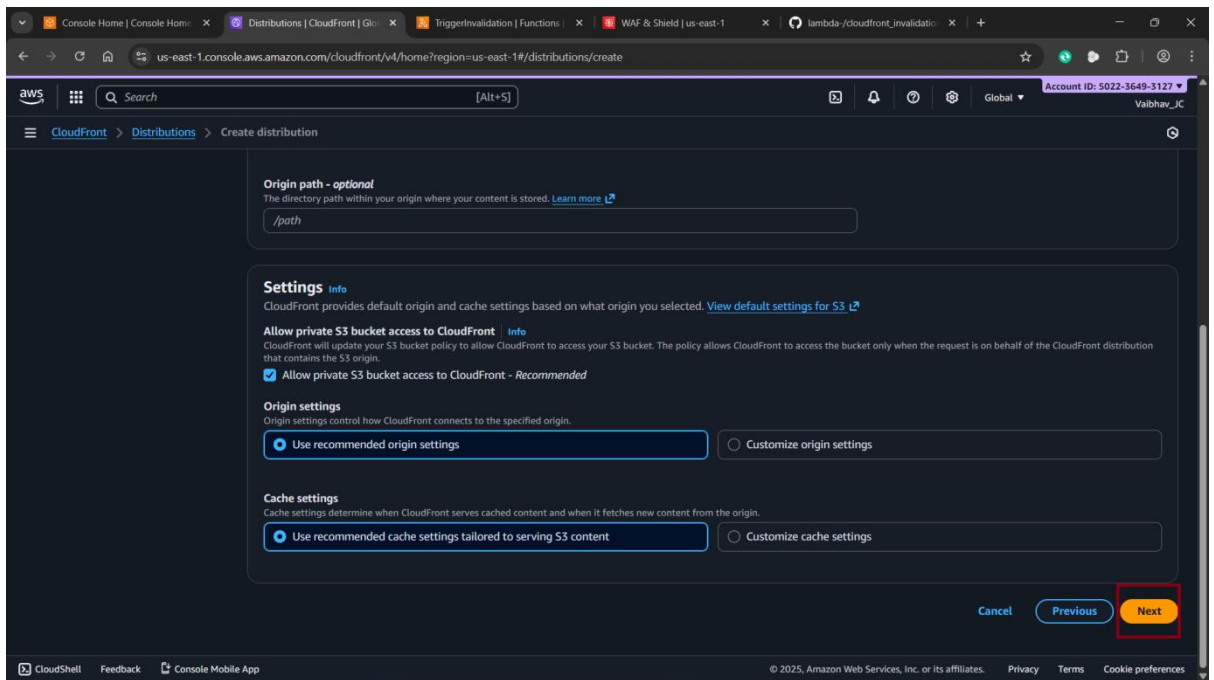

5. Choose free plan if available:

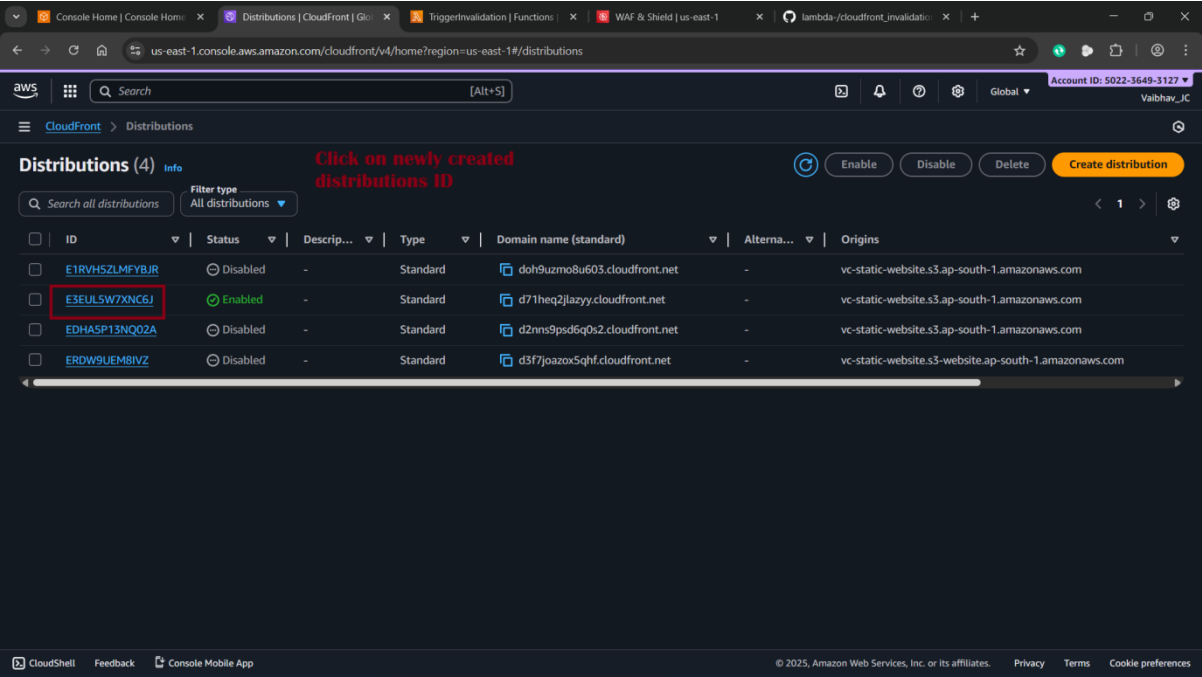

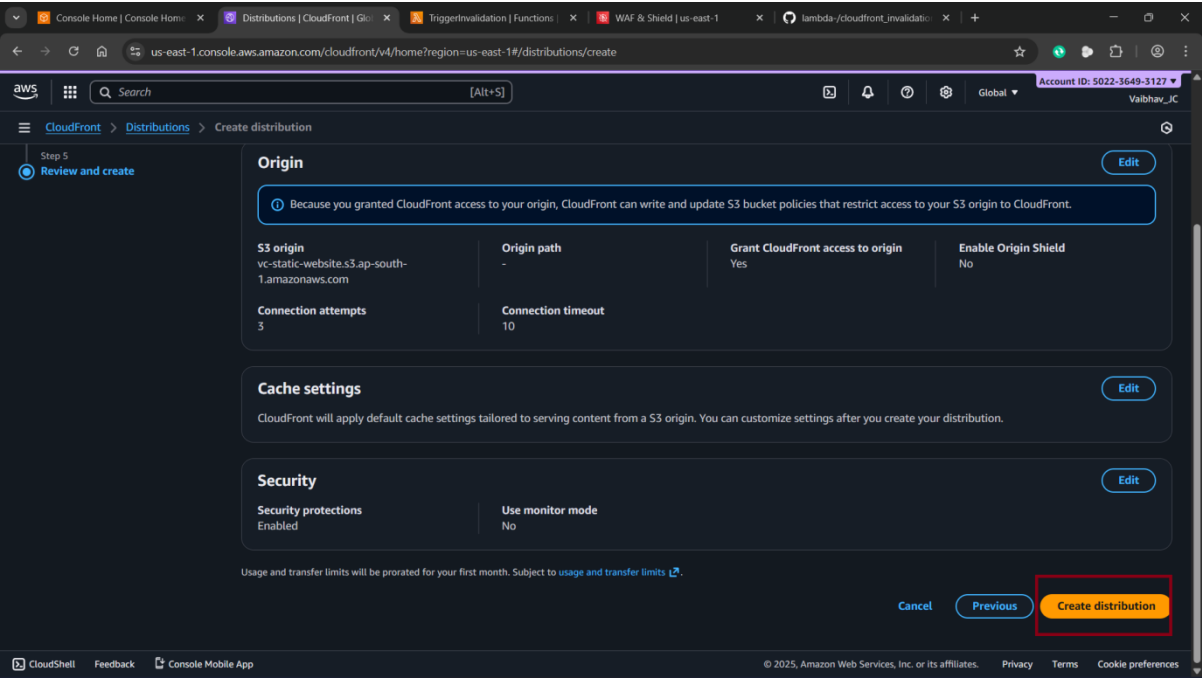

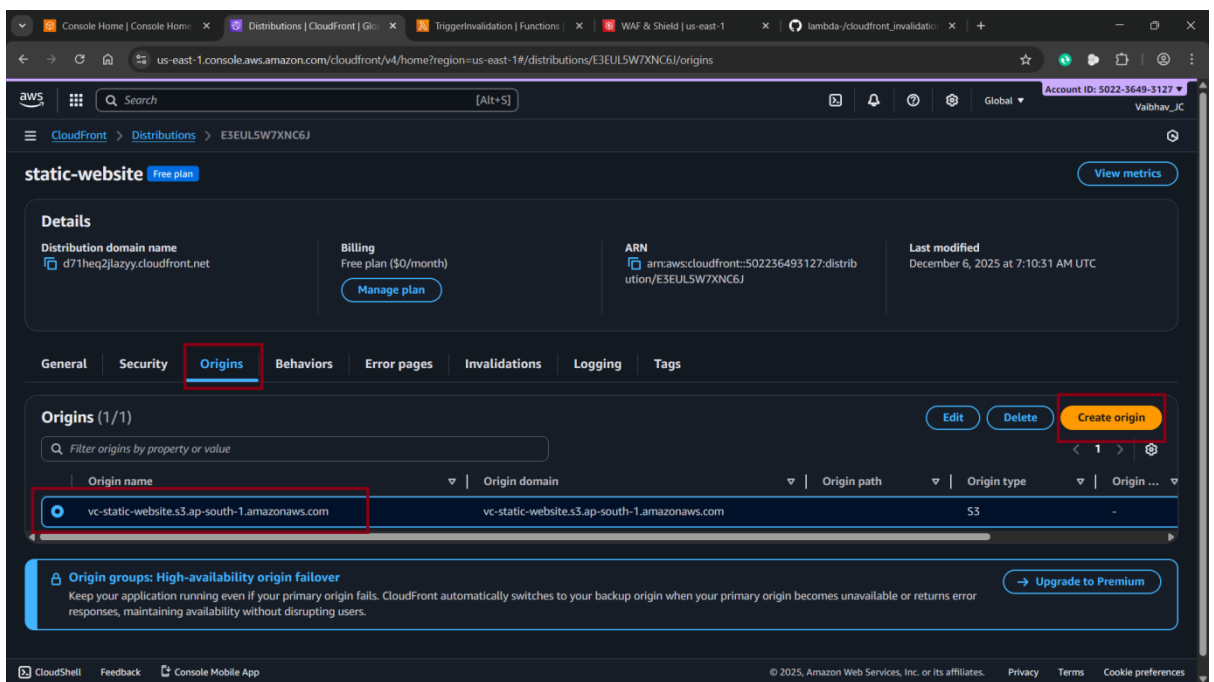

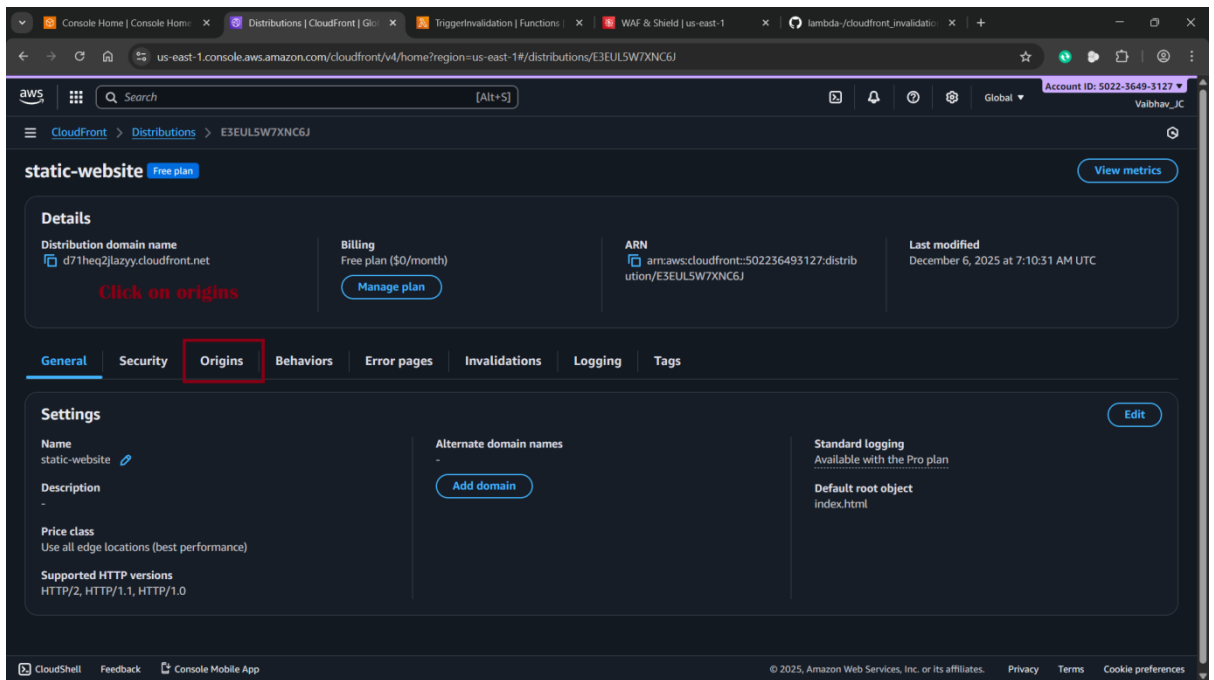

Click next

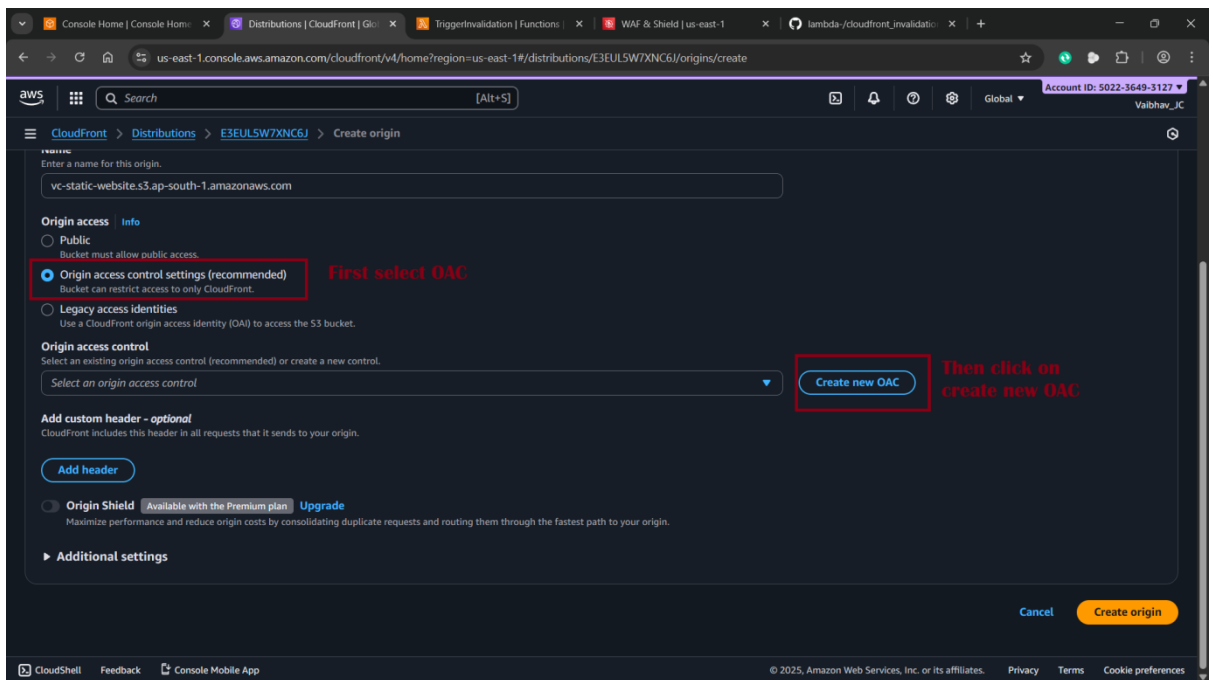

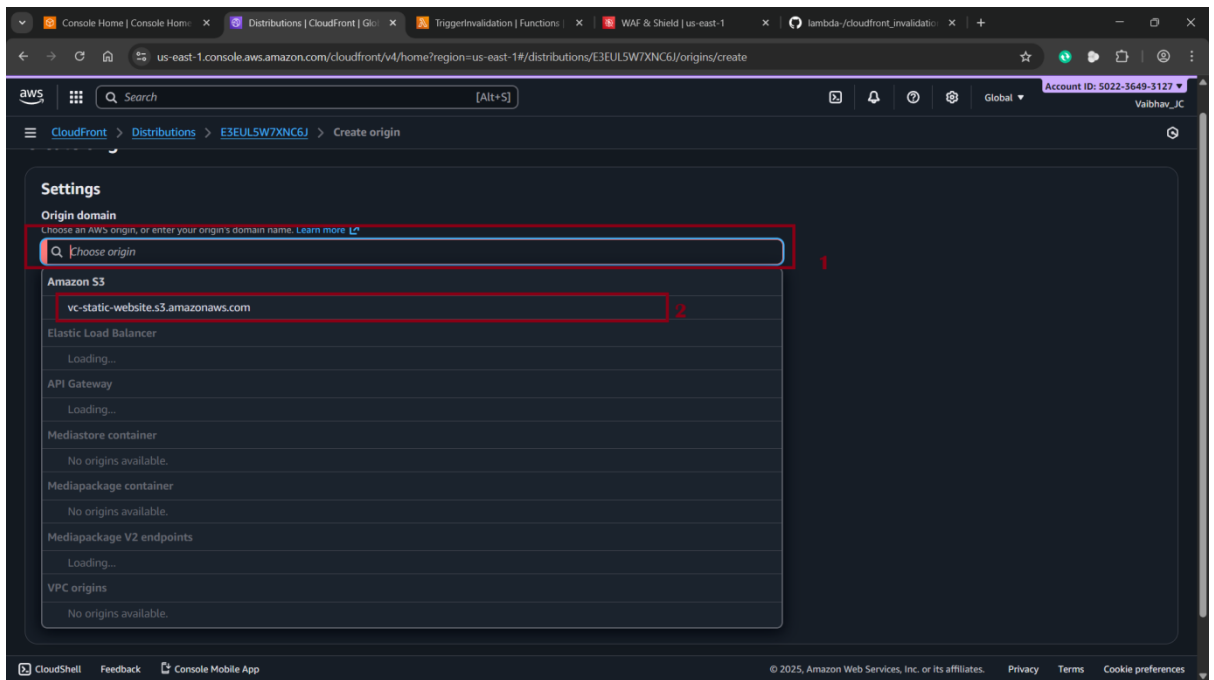

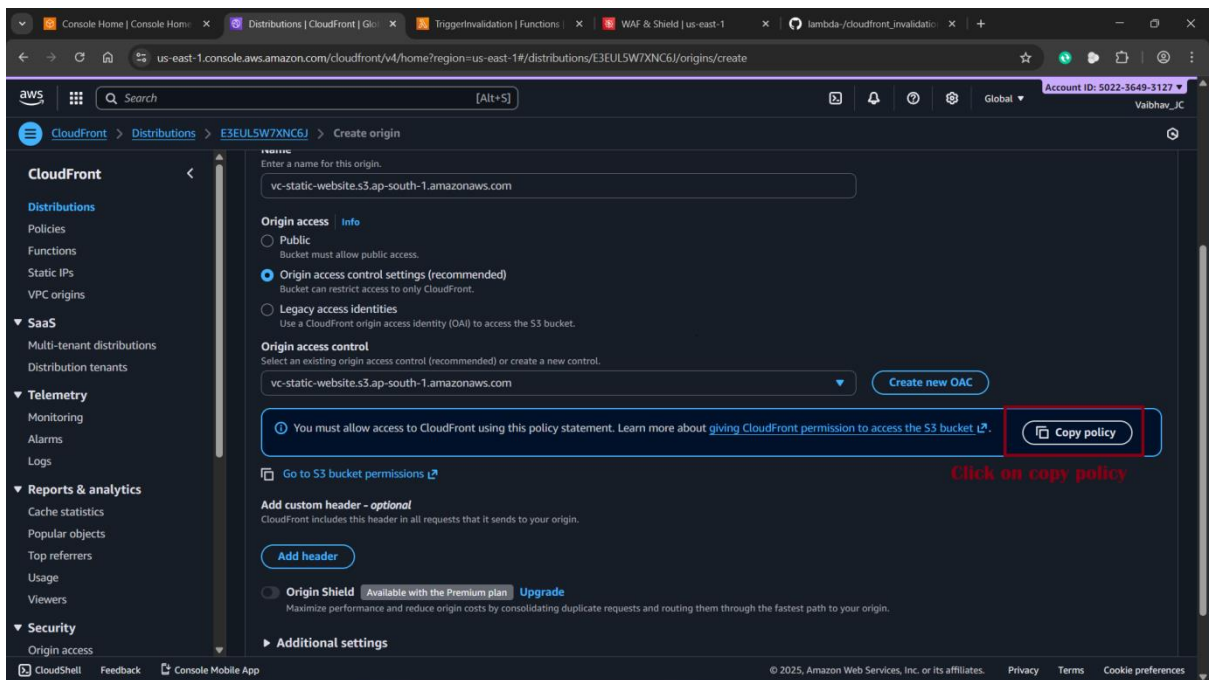

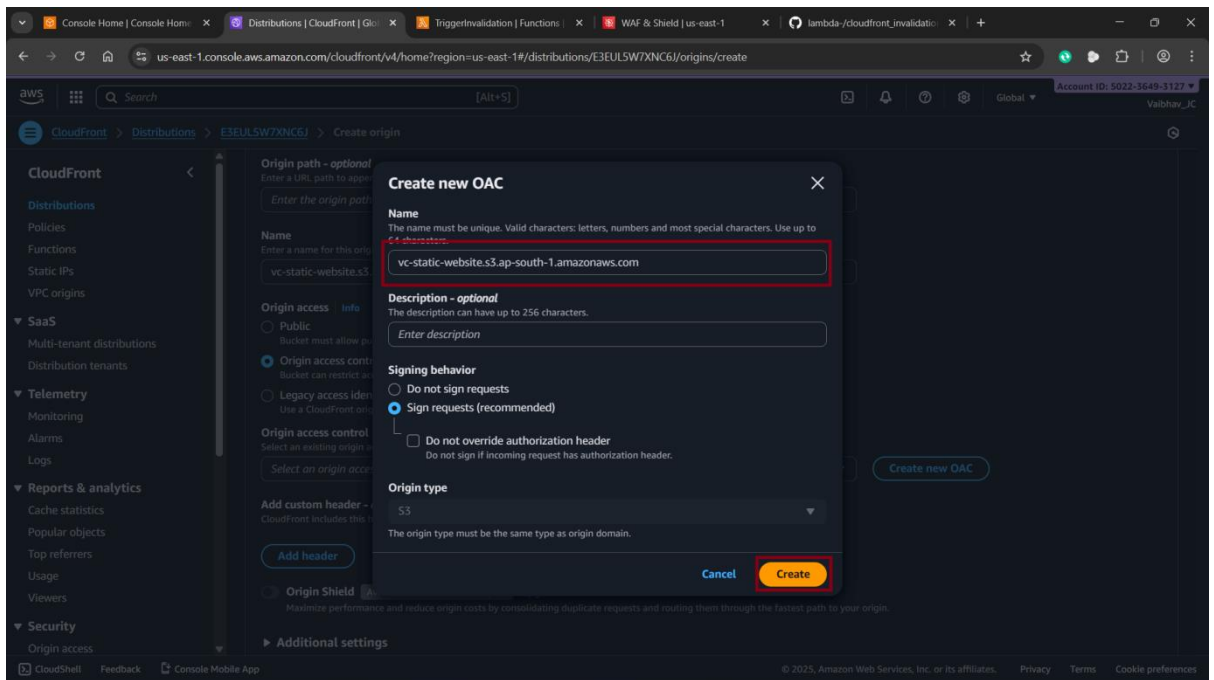

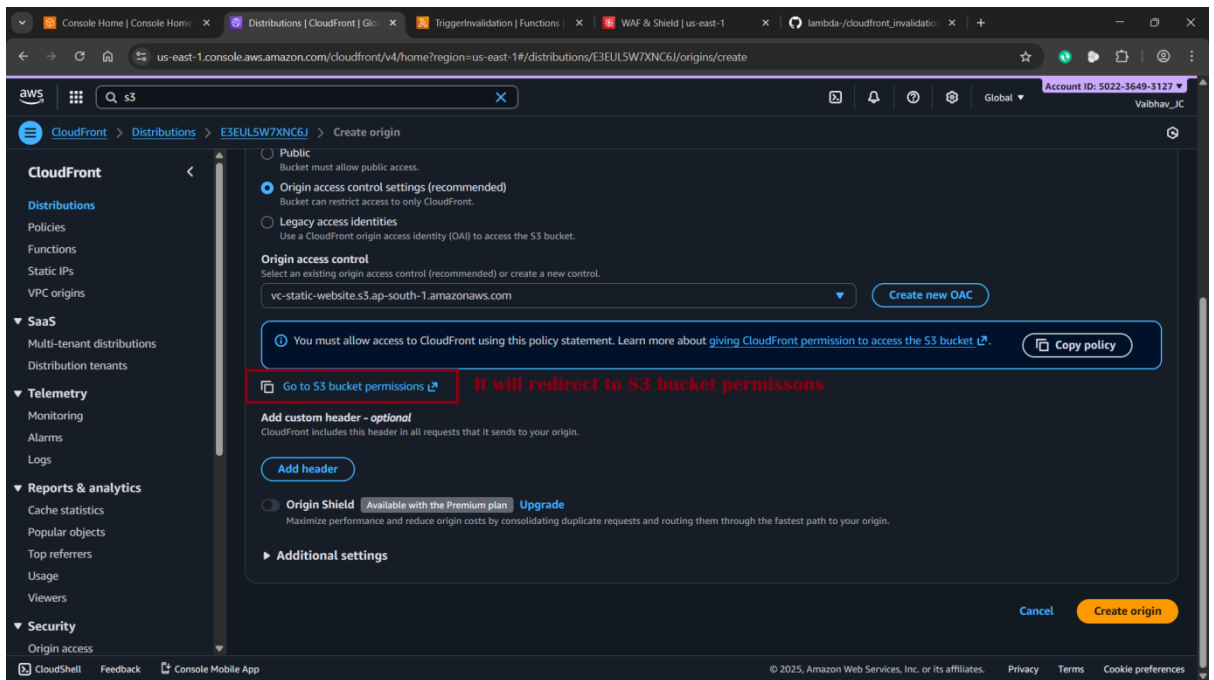

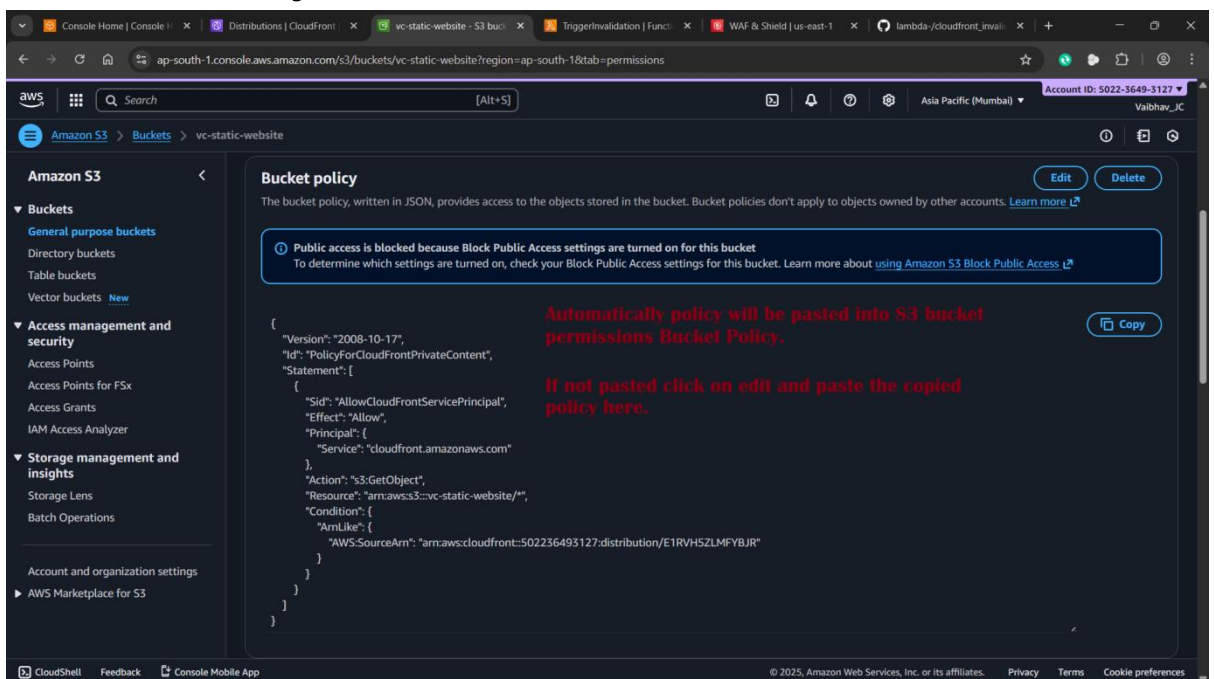

Select origin name and click on create origin

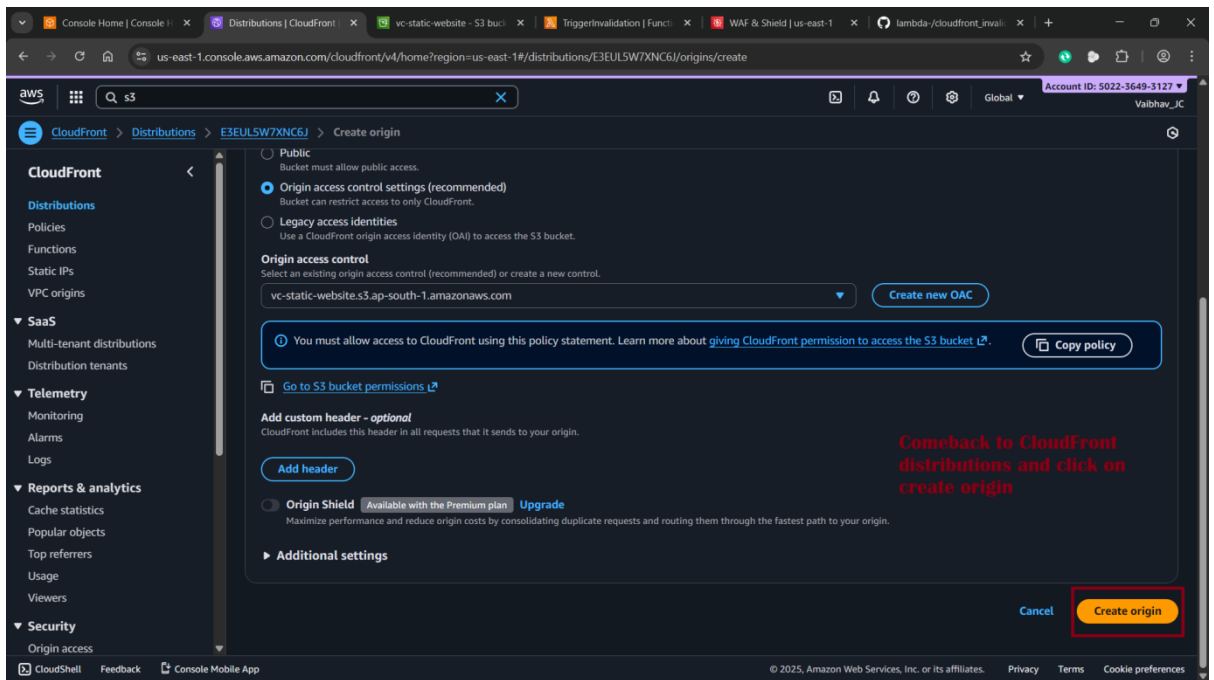

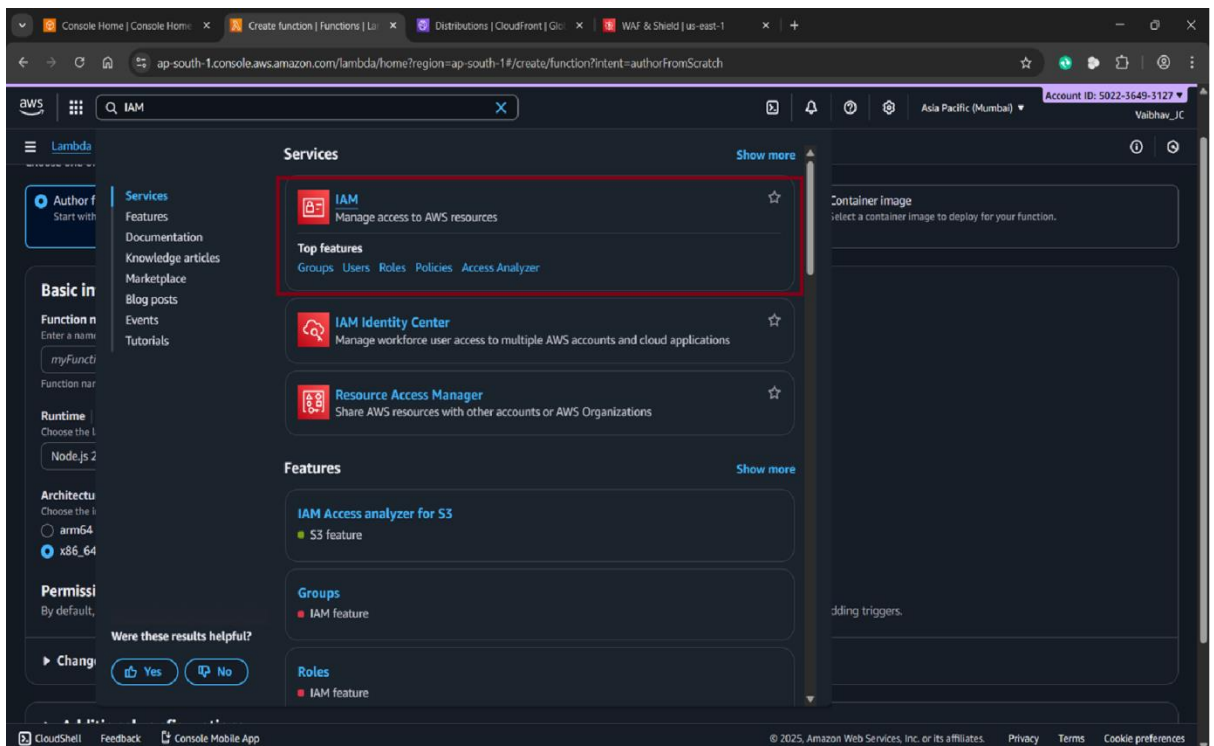

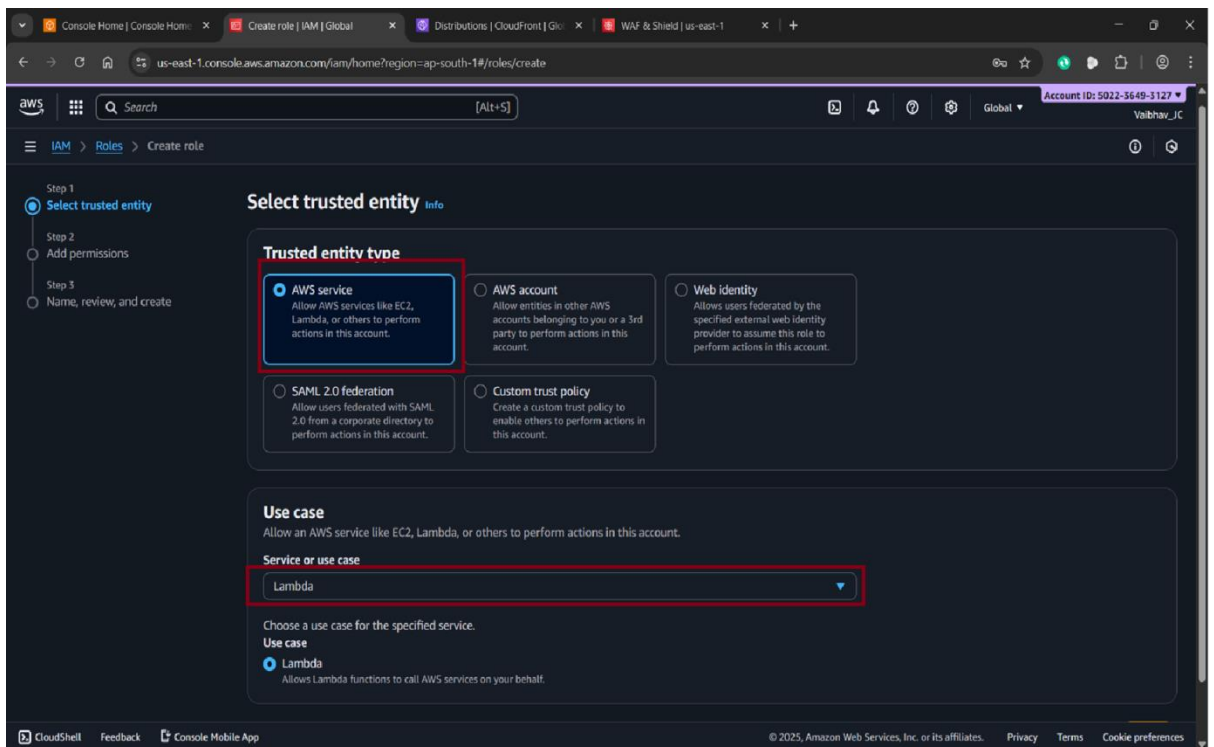

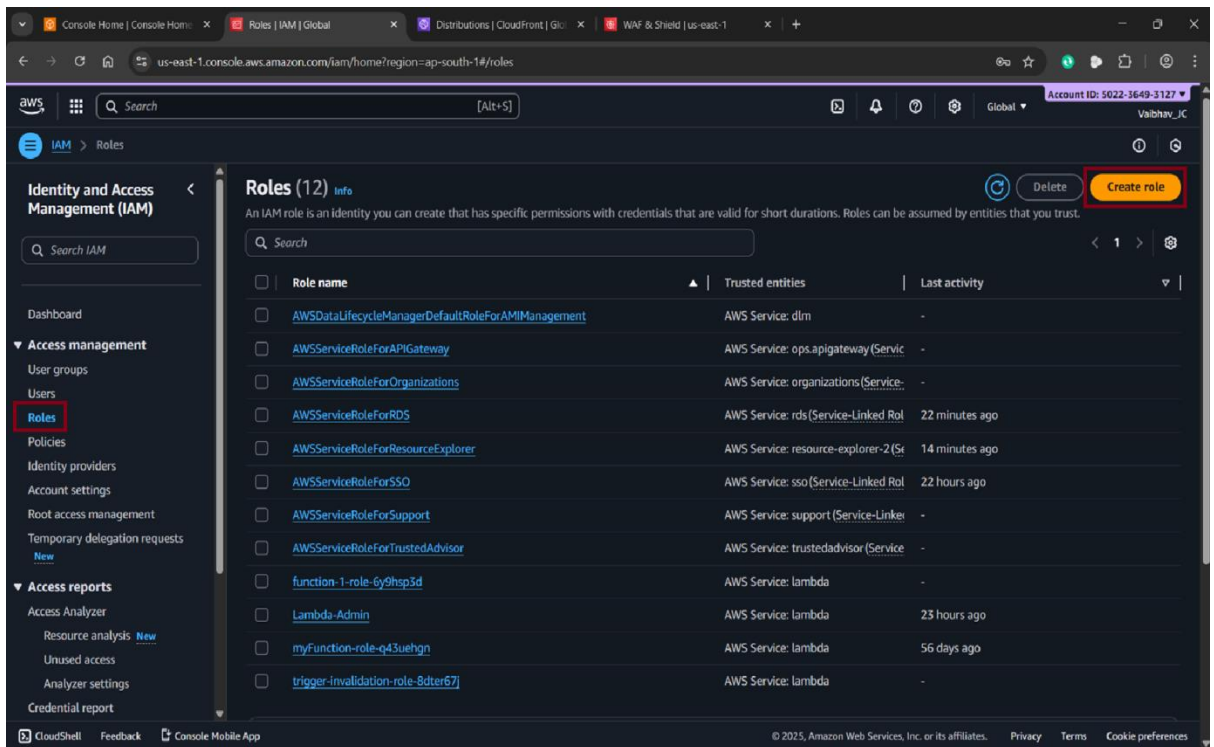

S3 bucket >> bucket_name >> Permissions >> Bucket Policy

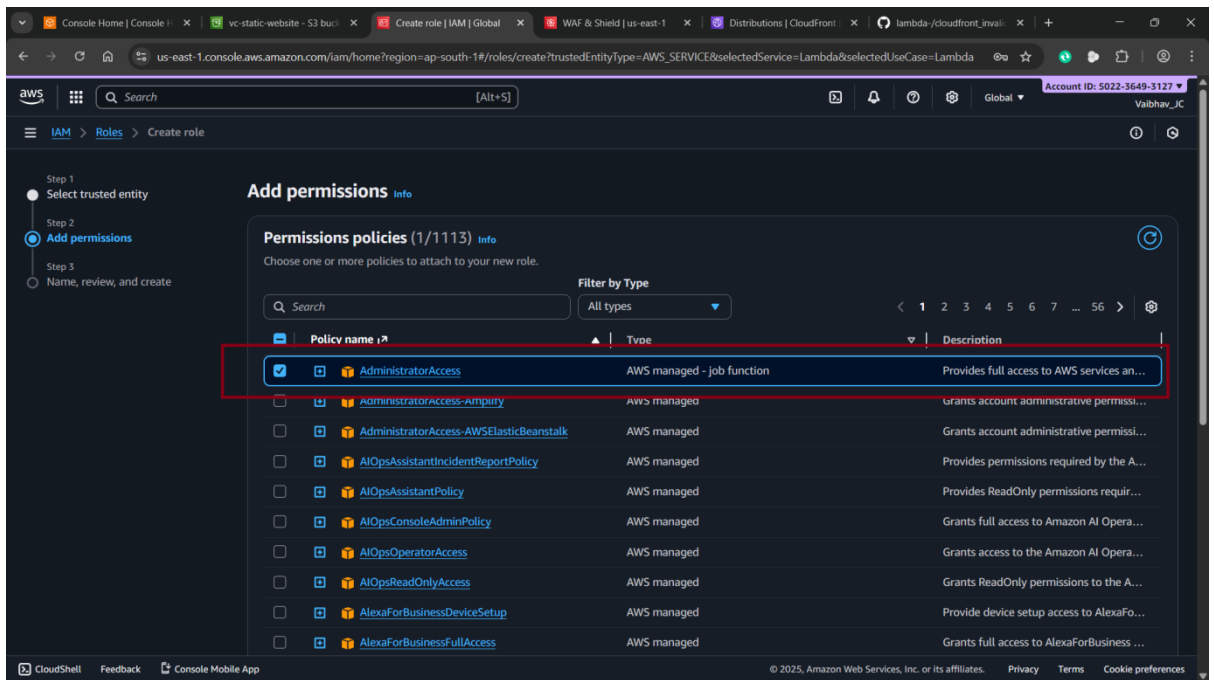

6. Search IAM and Create IAM role:

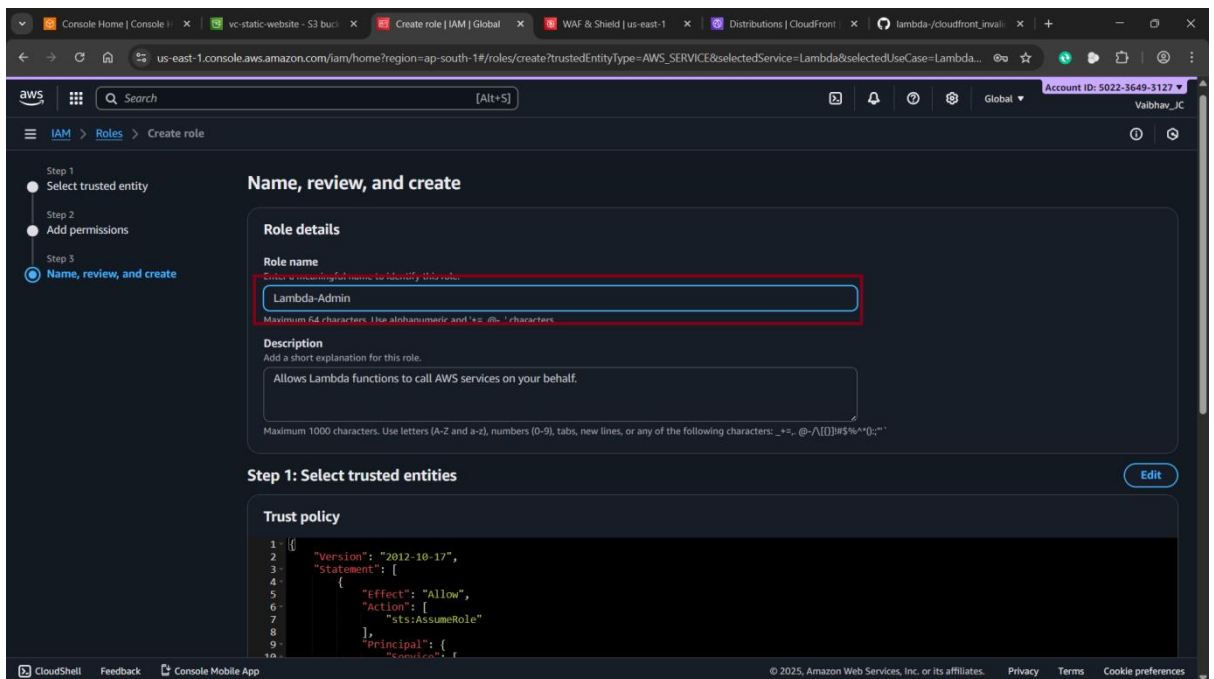

Next>>

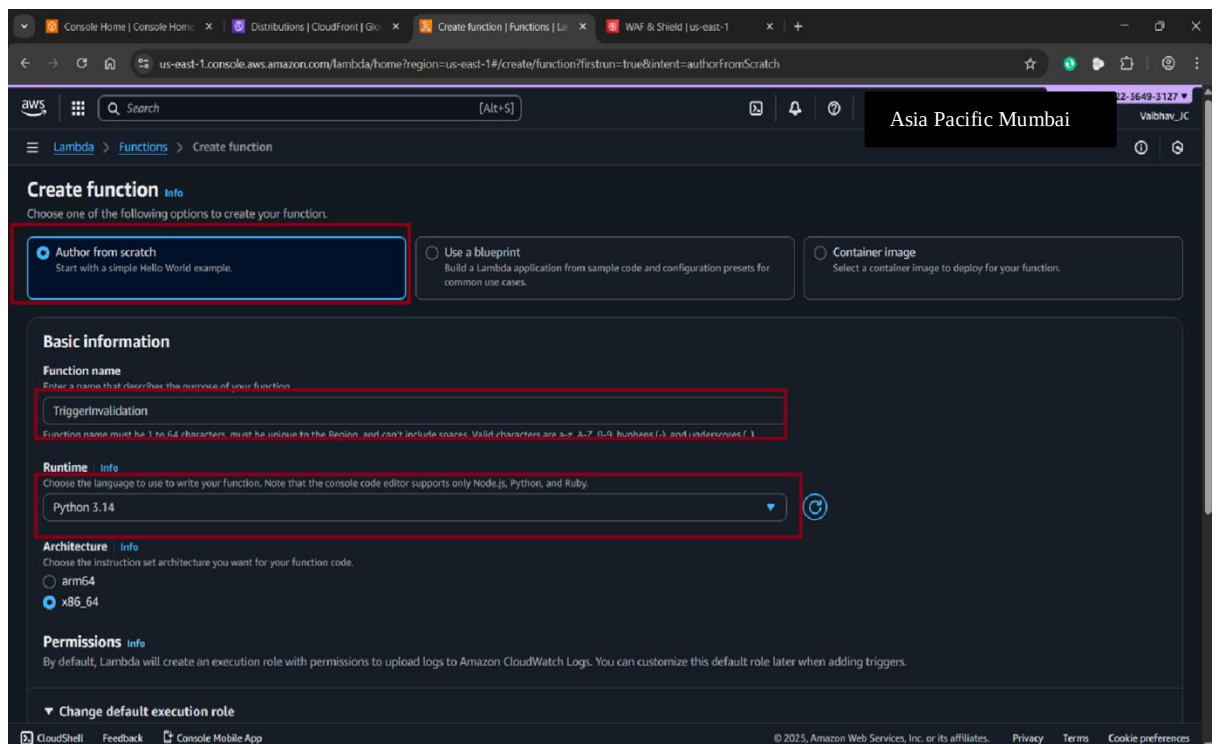

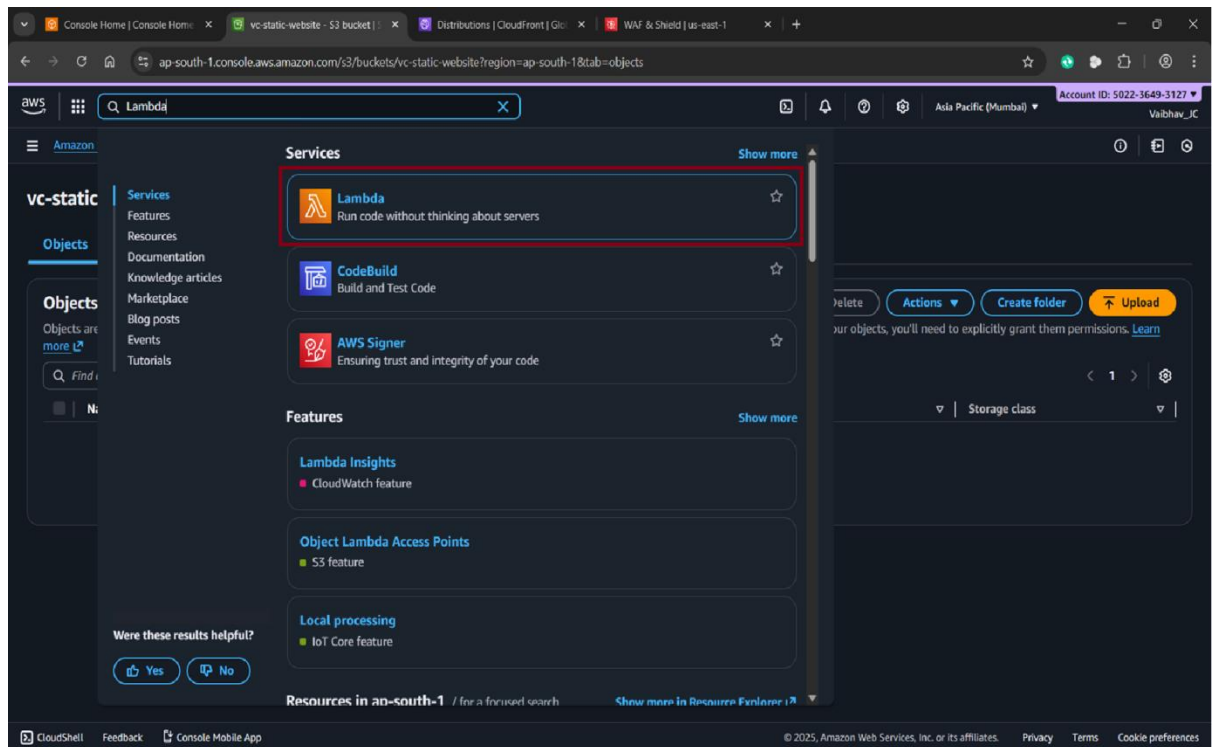

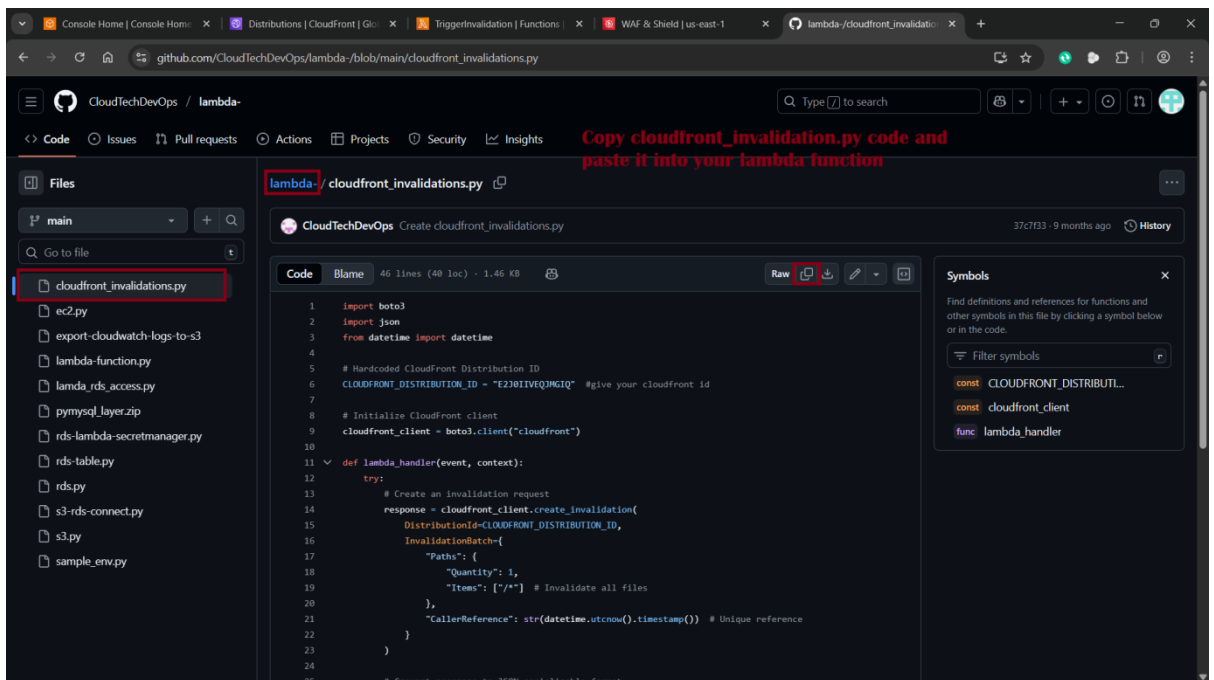

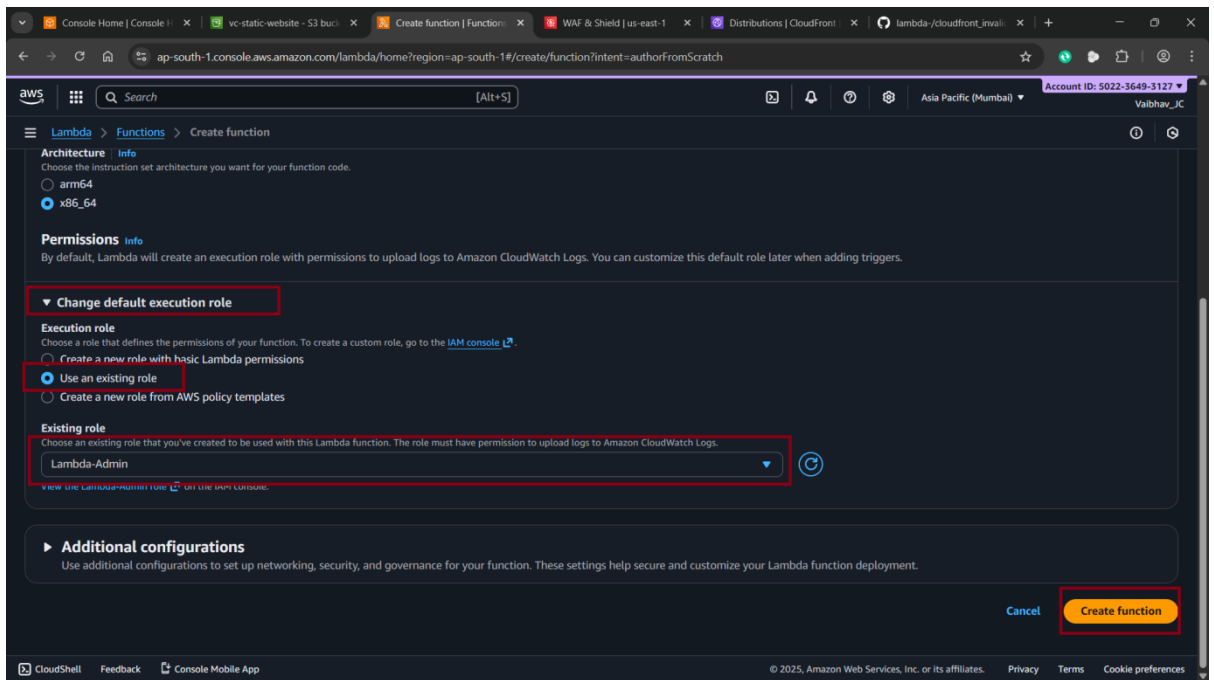

Next>>

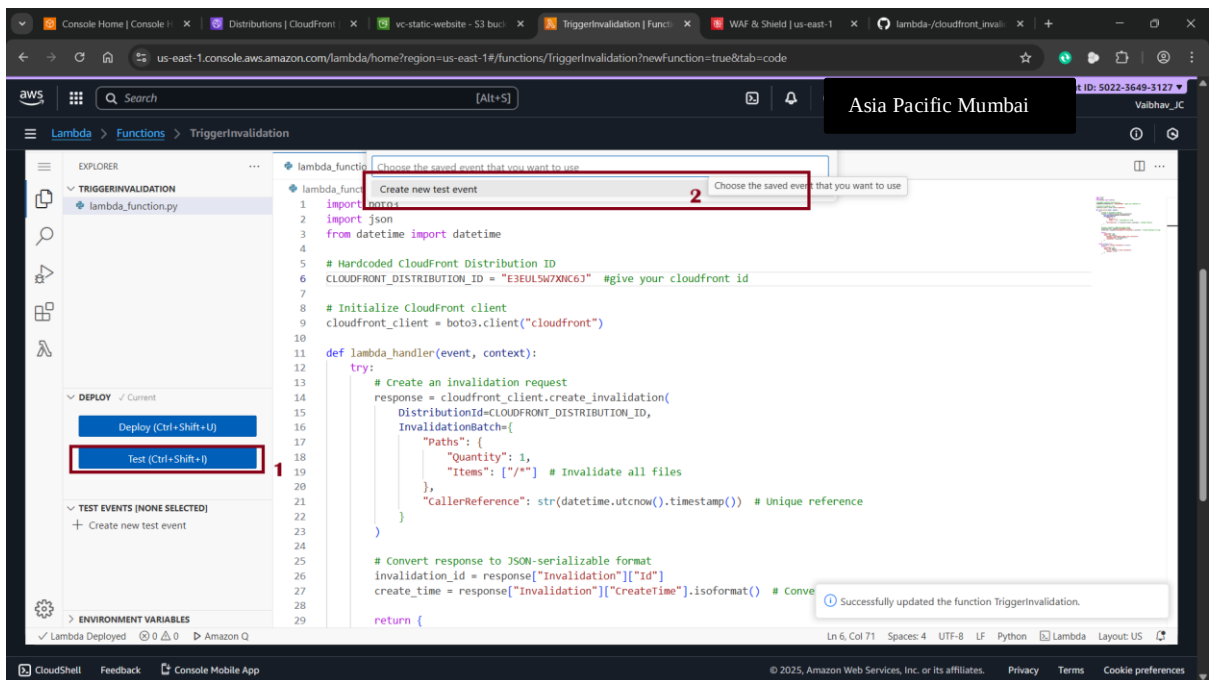

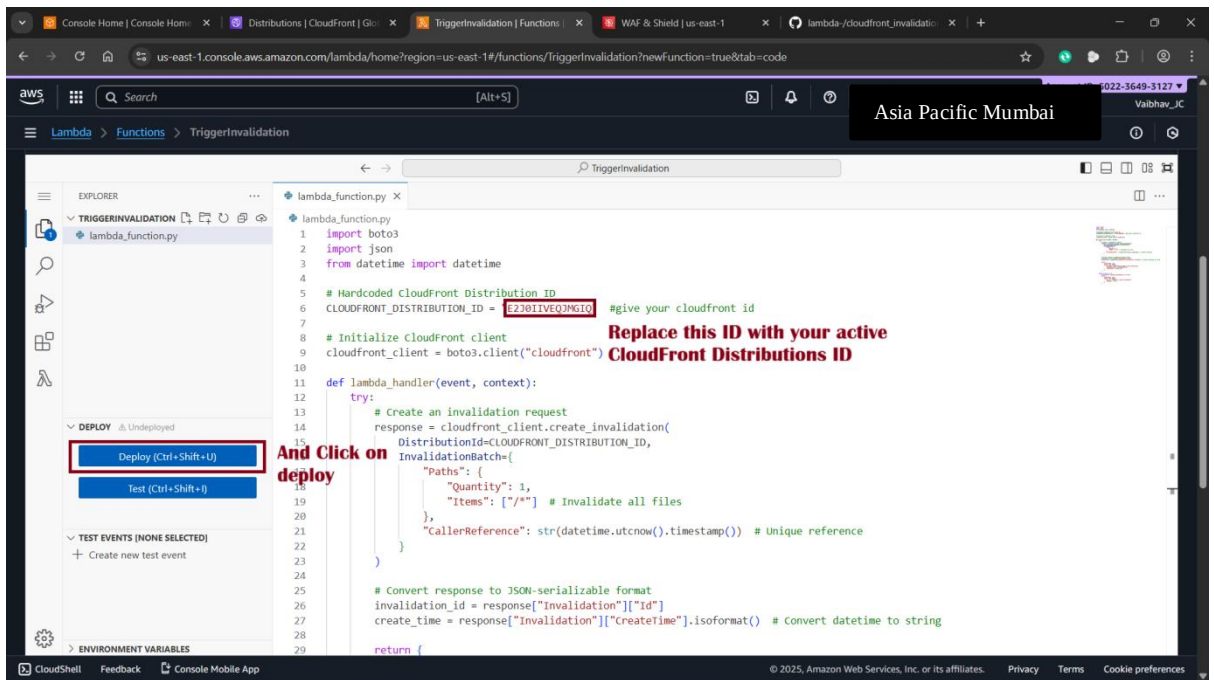

Create Role

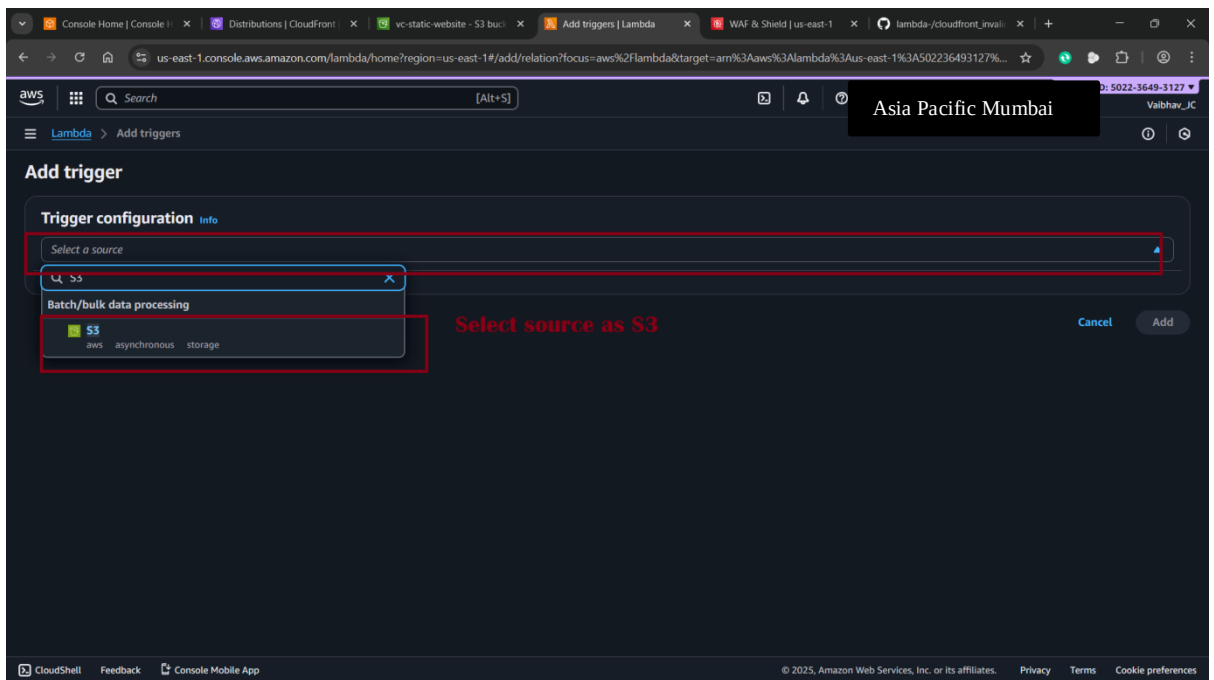

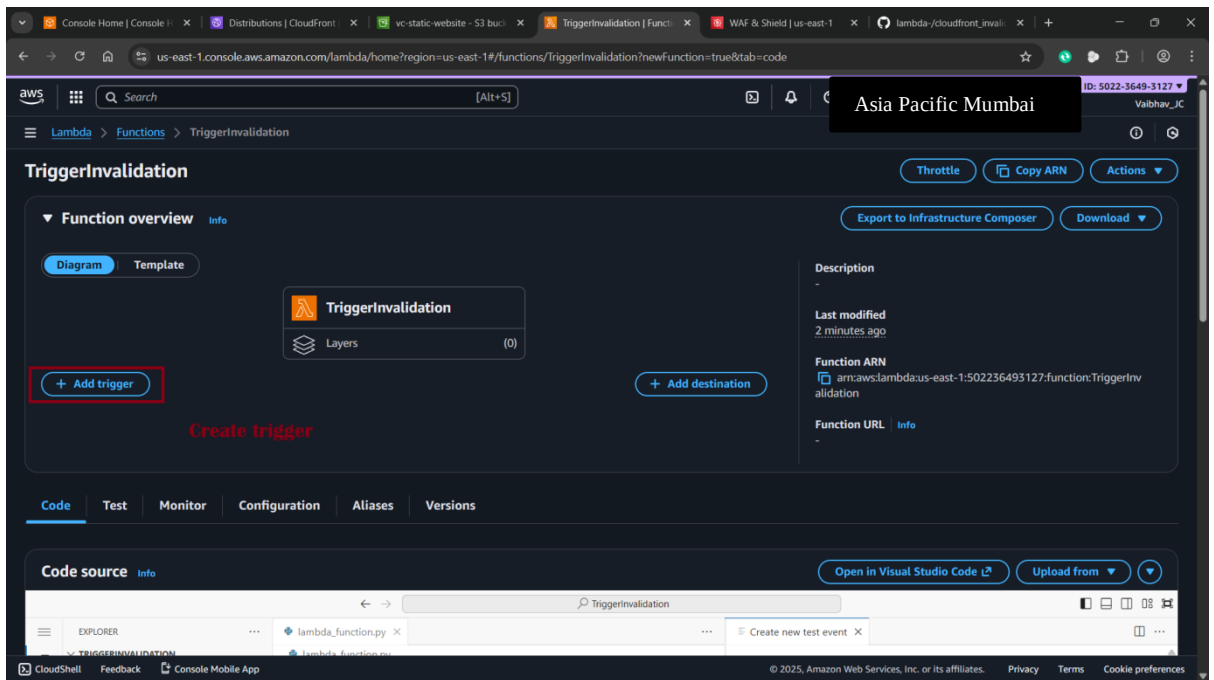

7. Search Lambda and create lambda function:

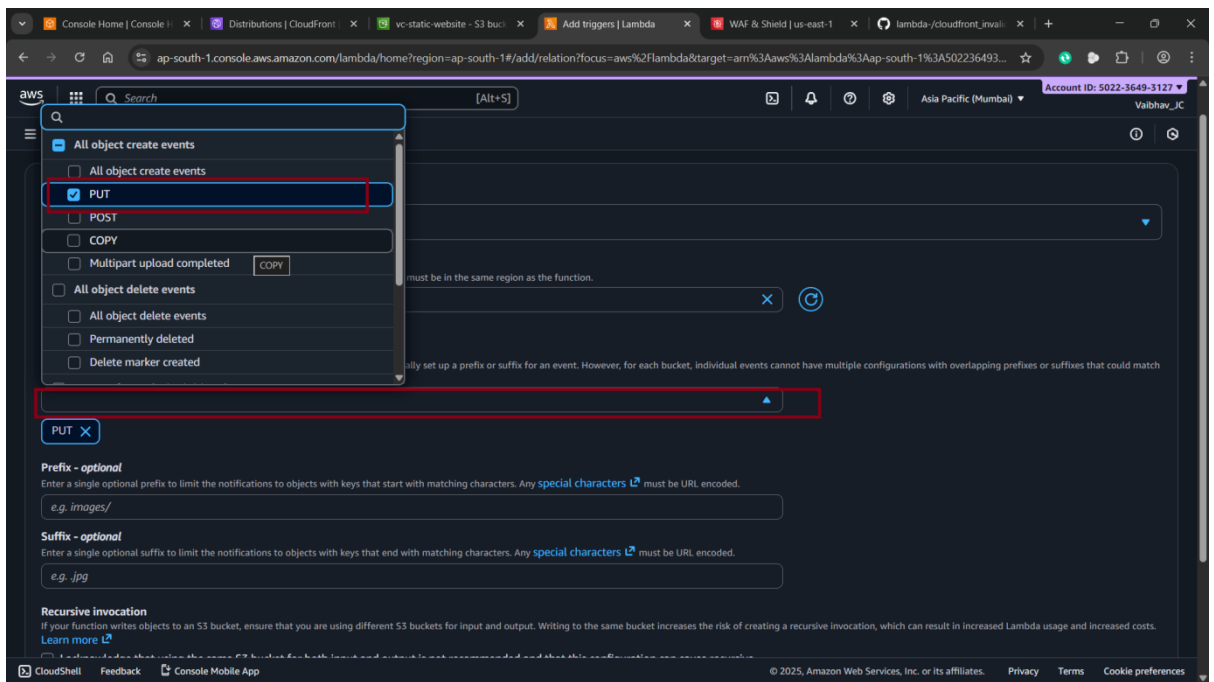

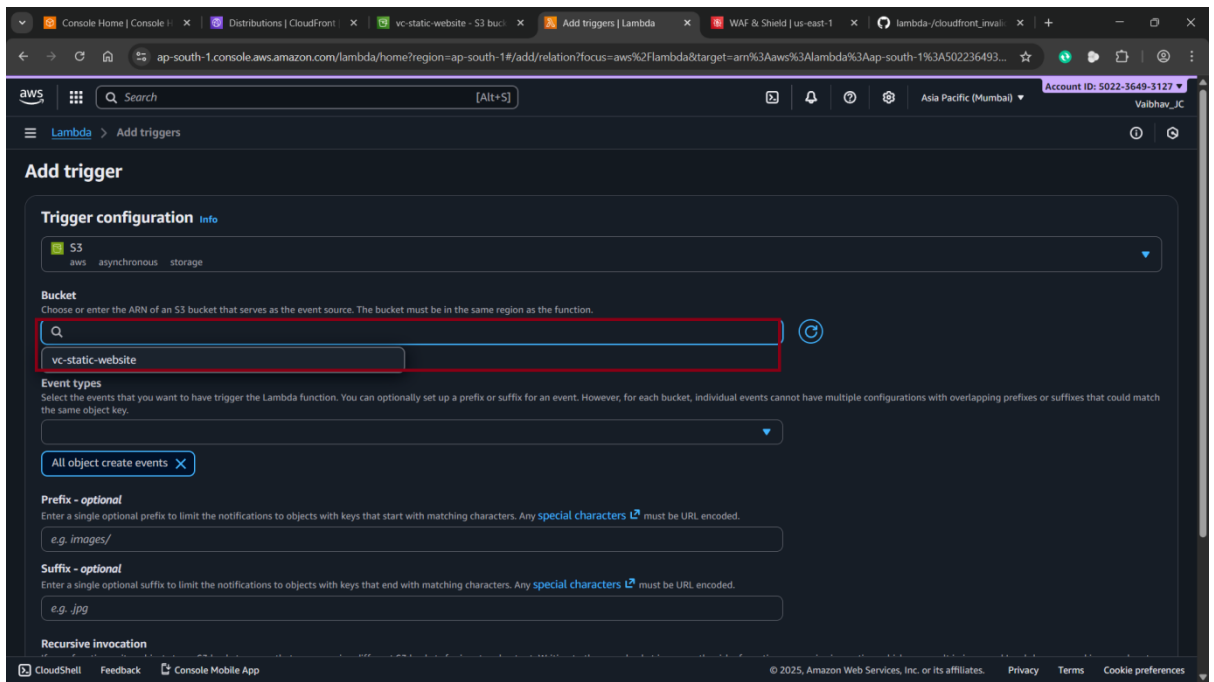

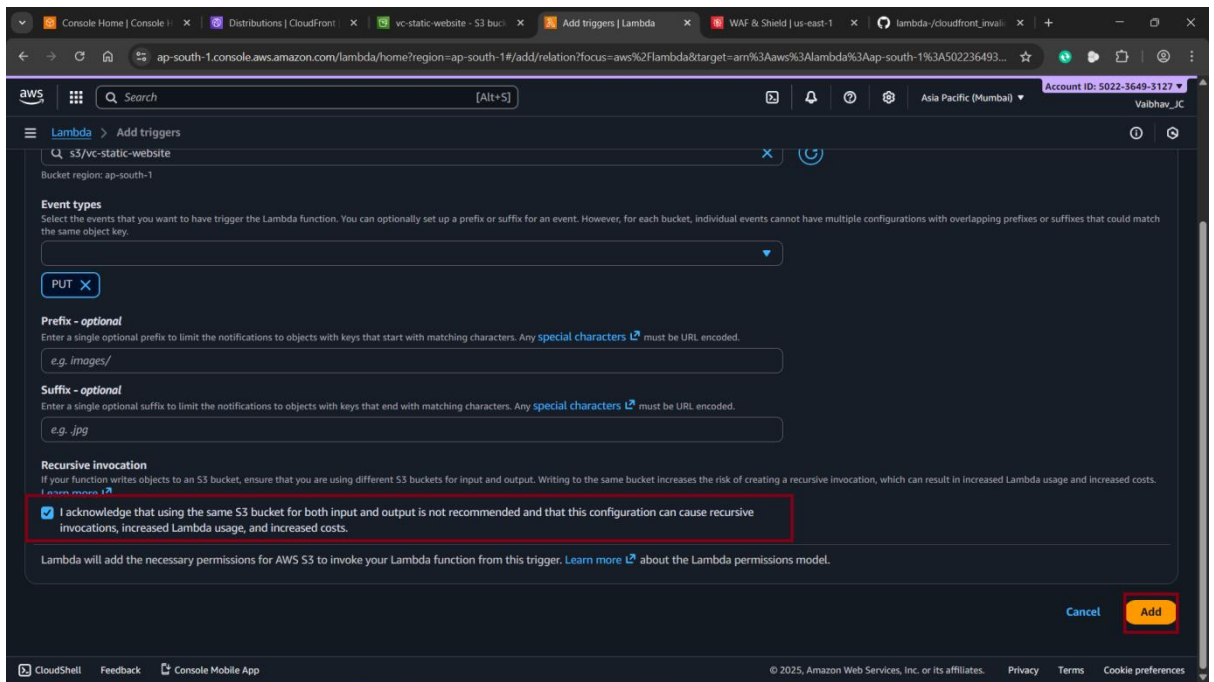

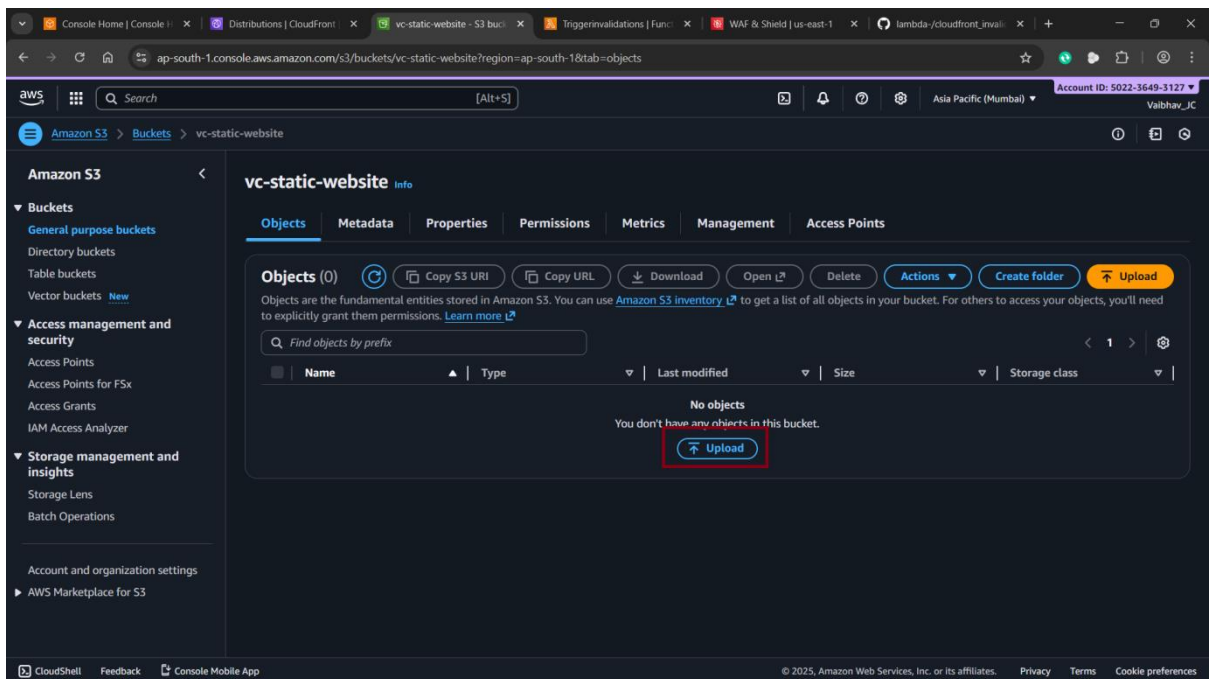

Create new test event and save.

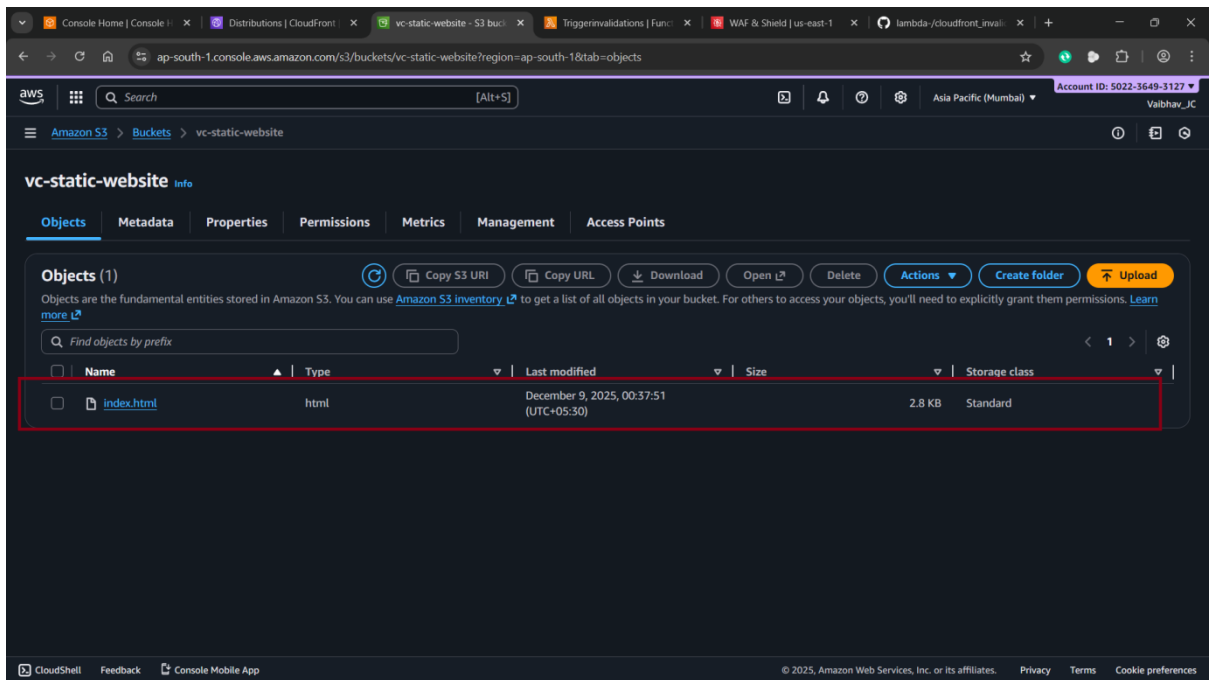

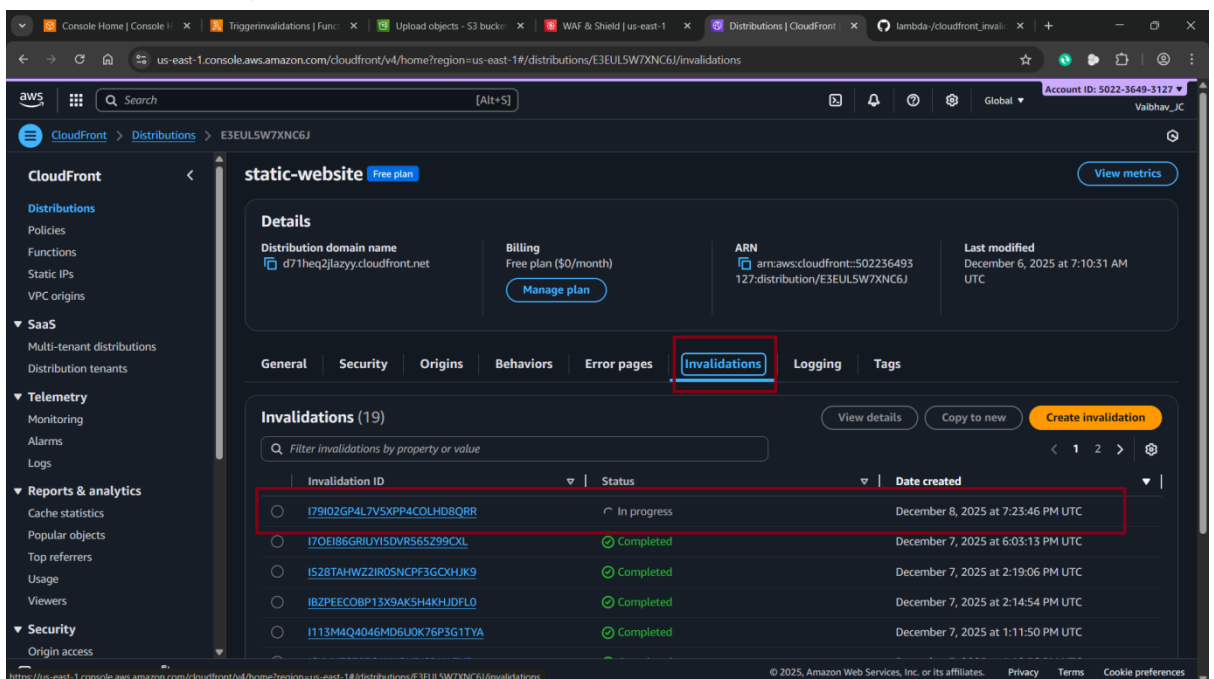

8. Go to S3 bucket and upload object

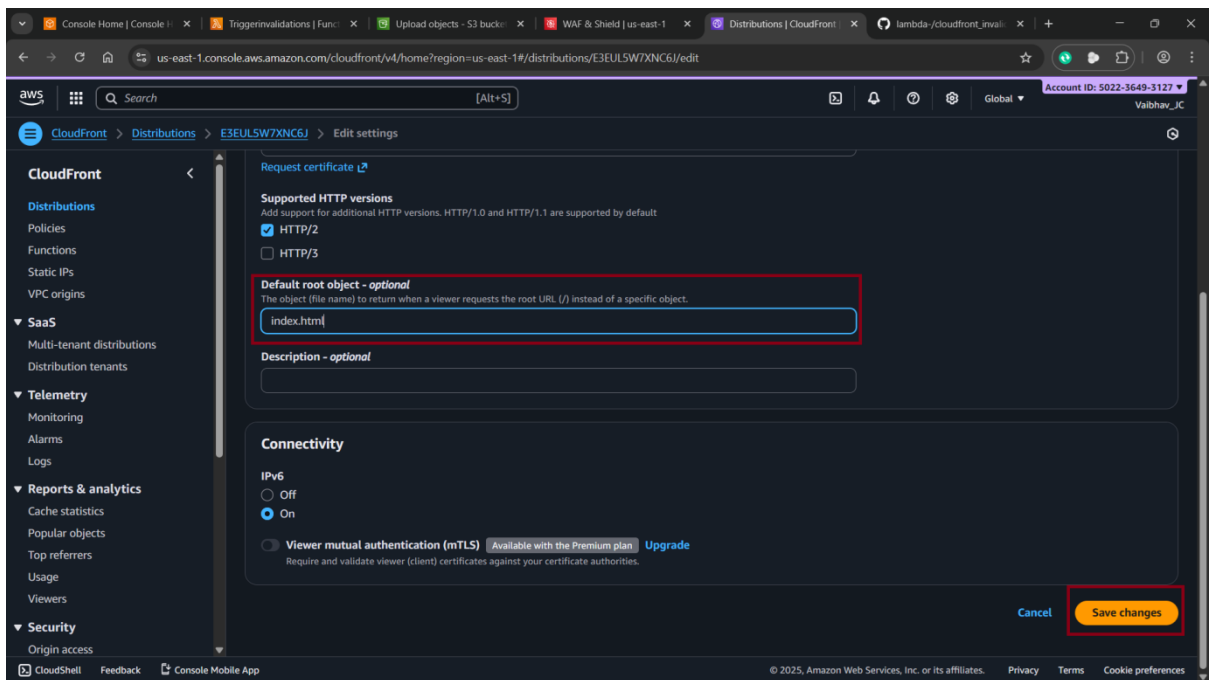

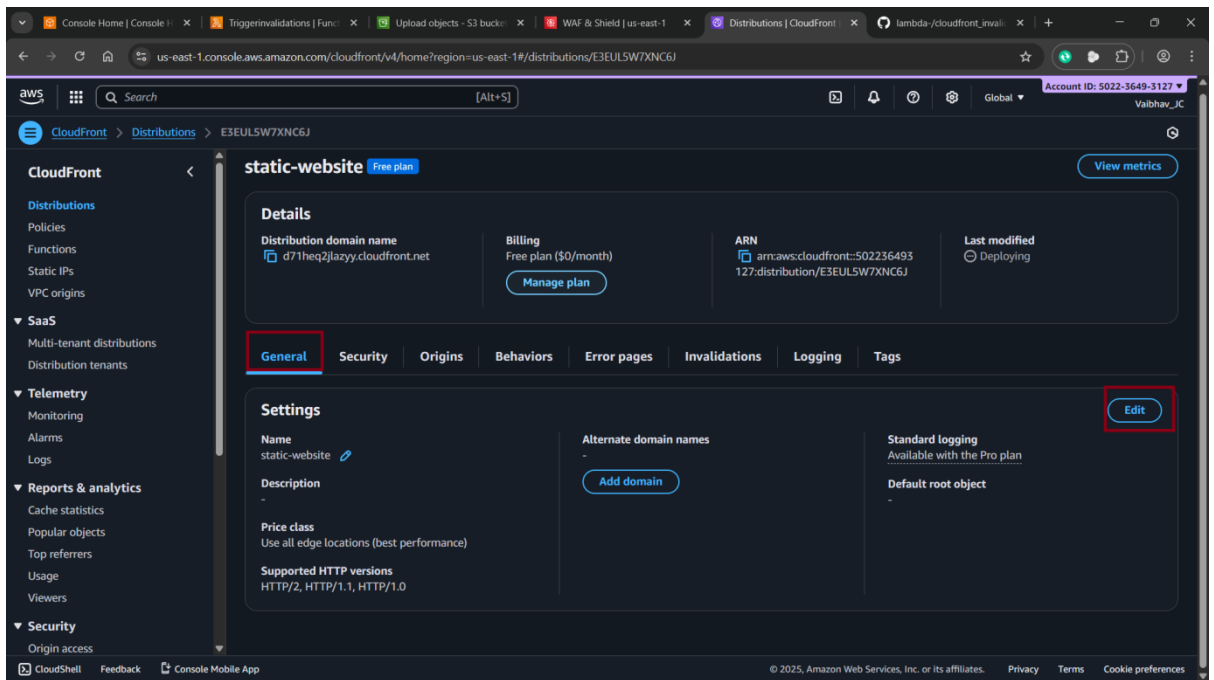

Upload index.html file

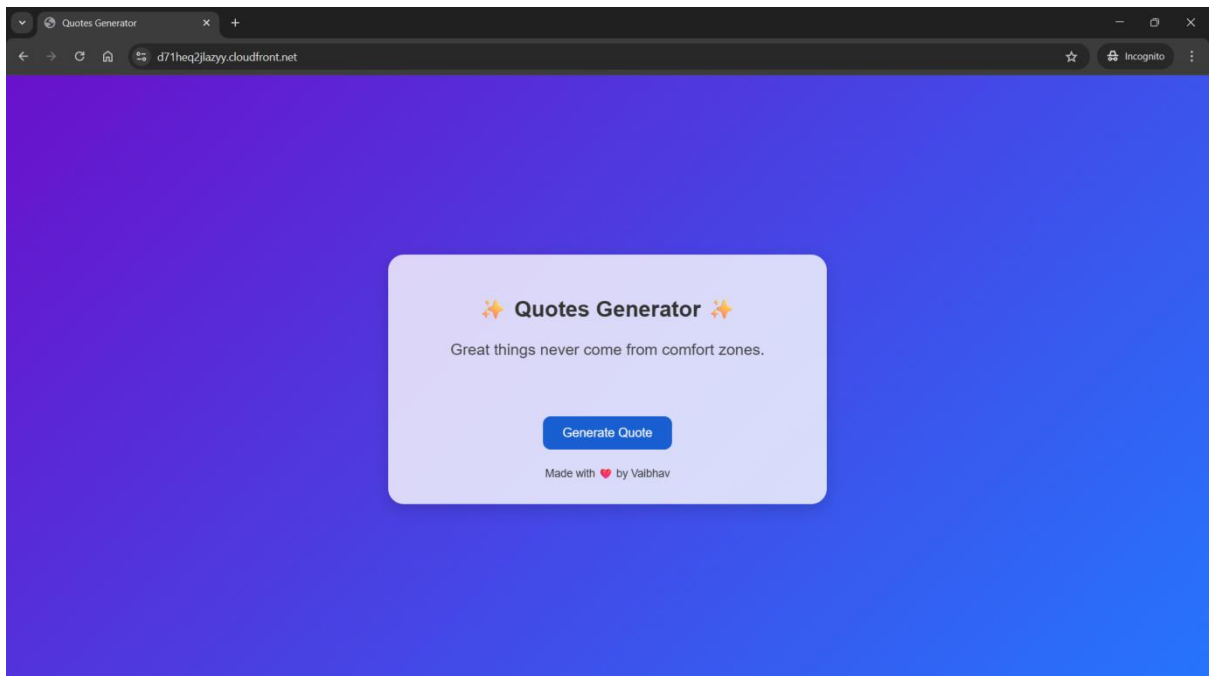

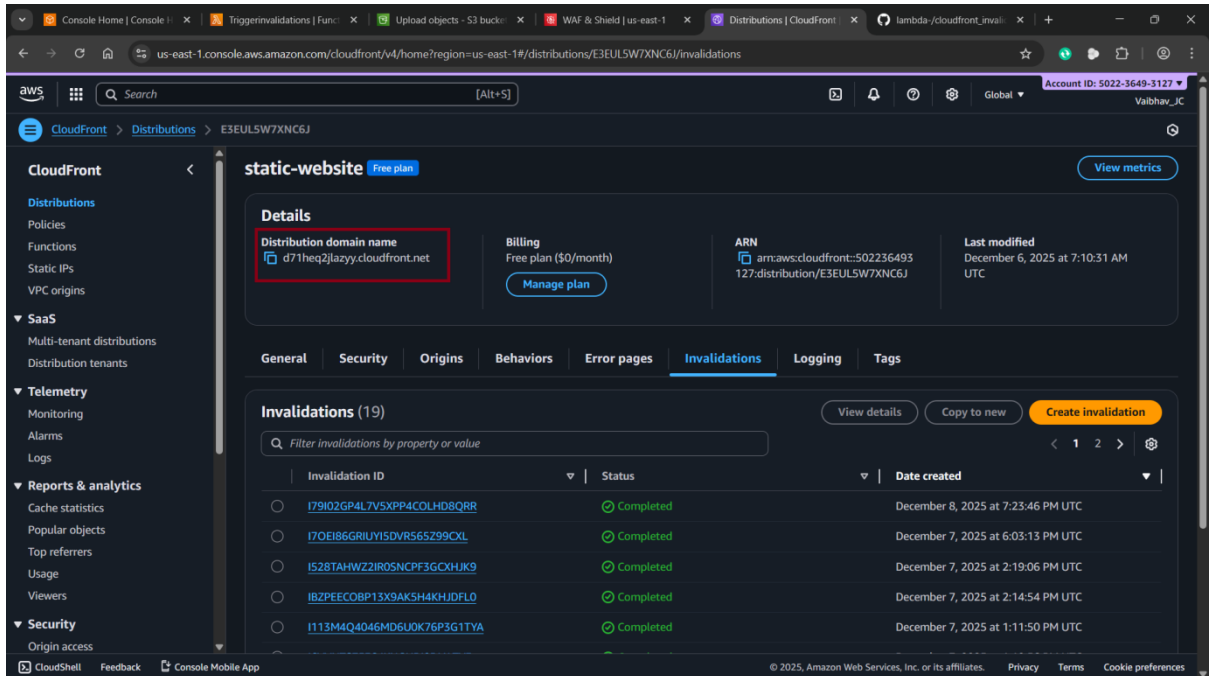

As we uploaded object inside S3 bucket immediately one invalidation will create.

Wait to complete Deploying process,

Now test your cloudFront domain:

To enable WAF refer to CloudFront WAF DOC
